Fisher Life History Ecology And Behavior:

The Fisher Roger A. Powell,1993 **Fisher** ,1982 *The Fisher* Roger A. Powell, *American Marten, Fisher, Lynx, and Wolverine* William J. Zielinski,Thomas E. Kucera,1998-05 In the Western U S the forest carnivores in this assessment are limited to boreal forest ecosystems These forests are characterized by extensive landscapes with a component of structurally complex mesic coniferous stands that are characteristic of late stages of forest development This report assesses the scientific basis for conserving the American marten fisher lynx wolverine It consists of literature reviews for each species a discussion of management considerations information needs Comprehensive **Biology and Conservation of Martens, Sables, and Fishers** Keith B. Aubry,William J. Zielinski,Martin G. Raphael,Gilbert Proulx,Steven W. Buskirk,2012-11-15 Mammals in the genus *Martes* are mid sized carnivores of great importance to forest ecosystems This book the successor to *Martens Sables and Fishers Biology and Conservation* provides a scientific basis for management and conservation efforts designed to maintain or enhance the populations and habitats of *Martes* species throughout the world The twenty synthesis chapters contained in this book bring together the perspectives and expertise of sixty three scientists from twelve countries and are organized by the five key themes of evolution and biogeography population biology and management habitat ecology and management research techniques and conservation Recent developments in research technologies such as modeling and genetics biological knowledge about pathogens and parasites and concerns about the potential effects of global warming on the distribution and status of *Martes* populations make new syntheses of these areas especially timely The volume provides an overview of what is known while clarifying initiatives for future research and conservation priorities and will be of interest to mammalogists resource managers applied ecologists and conservation biologists **General Technical Report RM.** ,1992 Historical Perspective on the Reintroduction of the Fisher and American Marten in Wisconsin and Michigan Bronwyn Waller Williams,2007 Management of mustelid species such as fishers and martens requires an understanding of the history of local populations This is particularly true in areas where populations were extirpated and restored through reintroduction efforts During the late 19th and 20th centuries fishers *Martes pennanti* and American martens *Martes americana* were extirpated from much of their southern range including Michigan and Wisconsin Both species have been restored to varying degrees in these states following multiple reintroductions and translocations We describe the status of the original populations and changes in their status over time and include source locations release sites release and reintroduction dates and demographic characteristics of released animals This synthesis is crucial for evaluating the relative success of reintroductions in Michigan and Wisconsin and combined with knowledge of the current condition of these populations can provide valuable guidance on the future management of these species We also assess the reintroduction of fishers and martens in Michigan and Wisconsin and discuss strategies for successful reintroductions **Martens and Fishers (Martes) in Human-Altered Environments** Daniel J. Harrison,Angela K. Fuller,Gilbert Proulx,2006-02-28 *Martens*

and Fishers Martes in Human Altered Environments An International Perspective examines the conditions where humans and martens are compatible and incompatible and promotes land use practices that allow Martes to be representatively distributed and viable All Martes have been documented to use forested habitats and 6 species excluding the stone marten are generally considered to require complex mid to late successional forests throughout much of their geographic ranges All species in the genus require complex horizontal and vertical structure to provide escape cover protection from predators habitat for their prey access to food resources and protection from the elements Martens and the fisher have high metabolic rates have large spatial requirements have high surface area to volume ratios for animals that often inhabit high latitudes and often require among the largest home range areas per unit body weight of any group of mammals Resulting from these unique life history characteristics this genus is particularly sensitive to human influences on their habitats including habitat loss stand scale simplification of forest structure via some forms of logging and landscape scale effects of habitat fragmentation Given their strong associations with structural complexity in forests martens and the fisher are often considered as useful barometers of forest health and have been used as ecological indicators flagship and umbrella species in different parts of the world Thus efforts to successfully conserve and manage martens and fishers are associated with the ecological fates of other forest dependent species and can greatly influence ecosystem integrity within forests that are increasingly shared among wildlife and humans We have made great strides in our fundamental understanding of how animals with these unique life history traits perceive and utilize habitats respond to habitat change and how their populations function and perform under different forms of human management and mismanagement This knowledge enhances our basic understanding of all species of Martes and will help us to achieve the goal of conserving viable populations and representative distributions of the world s Martes their habitats and associated ecological communities in our new millennium

The Evolution of Childhood Melvin Konner, 2011-11-30 This book is an intellectual tour de force a comprehensive Darwinian interpretation of human development Looking at the entire range of human evolutionary history Melvin Konner tells the compelling and complex story of how cross cultural and universal characteristics of our growth from infancy to adolescence became rooted in genetically inherited characteristics of the human brain All study of our evolution starts with one simple truth human beings take an extraordinarily long time to grow up What does this extended period of dependency have to do with human brain growth and social interactions And why is play a sign of cognitive complexity and a spur for cultural evolution As Konner explores these questions and topics ranging from bipedal walking to incest taboos he firmly lays the foundations of psychology in biology As his book eloquently explains human learning and the greatest human intellectual accomplishments are rooted in our inherited capacity for attachments to each other In our love of those we learn from we find our way as individuals and as a species Never before has this intersection of the biology and psychology of childhood been so brilliantly described Nothing in biology makes sense except in the light of evolution wrote Dobzhansky In

this remarkable book Melvin Konner shows that nothing in childhood makes sense except in the light of evolution
