Functional Analysis and Evolution Equations Herbert Amann, Wolfgang Arendt, Frank Neubrander, Serge Nicaise, Joachim Below, 2008-02-28 Gunter Lumer was an outstanding mathematician whose works have great influence on the research community in mathematical analysis and evolution equations He was at the origin of the breath taking development the theory of semigroups saw after the pioneering book of Hille and Phillips from 1957 This volume contains invited contributions presenting the state of the art of these topics and reflecting the broad interests of Gunter Lumer

History of Functional Analysis J. Dieudonne, 1983-01-01 History of Functional Analysis presents functional analysis as a rather complex blend of algebra and topology with its evolution influenced by the development of these two branches of mathematics The book adopts a narrower definition one that is assumed to satisfy various algebraic and topological conditions A moment of reflections shows that this already covers a large part of modern analysis in particular the theory of partial differential equations This volume comprises nine chapters the first of which focuses on linear differential equations and the Sturm Liouville problem The succeeding chapters go on to discuss the crypto integral equations including the Dirichlet principle and the Beer Neumann method the equation of vibrating membranes including the contributions of Poincare and H A Schwarz s 1885 paper and the idea of infinite dimension Other chapters cover the crucial years and the definition of Hilbert space including Fredholm s discovery and the contributions of Hilbert duality and the definition of normed spaces including the Hahn Banach theorem and the method of the gliding hump and Baire category spectral theory after 1900 including the theories and works of F Riesz Hilbert von Neumann Weyl and Carleman locally convex spaces and the theory of distributions and applications of functional analysis to differential and partial differential equations This book will be of interest to practitioners in the fields of mathematics and

statistics *Summability Through Functional Analysis* A. Anniversary Volume on Approximation Theory and Functional Analysis P. L. Butzer, R. L. Stens, B. Sz.-Nagy, 2013-11-21 These Proceedings include 42 of the 49 invited conference papers three papers submitted subsequently and a report devoted to new and unsolved problems based on two special problem sessions and as augmented by later communications from the participants In addition there are four short accounts that emphasize the personality of the scholars to whom the proceedings are dedicated Due to the large number of contributors the length of the papers had to be restricted This volume is again devoted to recent significant results obtained in approximation theory harmonic analysis functional analysis and operator theory The papers solicited include in addition survey articles that not only describe fundamental advances in their subfields but many also emphasize basic interconnections between the various research areas They tend to reflect the range of interests of the organizers and of their immediate colleagues and collaborators The papers have been grouped according to subject matter into ten chapters Chapter I on operator theory is devoted to certain classes of operators such as contraction hyponormal and accretive operators as well as to suboperators and semi groups of operators Chapter II on functional analysis contains papers on function spaces algebras ideals and generalized functions Chapter III on abstract approximation is concerned with the comparison of approximation processes the gliding hump method certain interpolation spaces and n widths

Functional Analysis I Yu. I. Lyubich, 2013-03-09 Up to a certain time the attention of mathematicians was concentrated on the study of individual objects for example specific elementary functions or curves defined by special equations With the creation of the method of Fourier series which allowed mathematicians to work with arbitrary functions the individual approach was replaced by the class approach in which a particular function is considered only as an element of some function space More or less simultaneously the development of geometry and algebra led to the general concept of a linear space while in analysis the basic forms of convergence for series of functions were identified uniform mean square pointwise and so on It turns out moreover that a specific type of convergence is associated with each linear function space for example uniform convergence in the case of the space of

continuous functions on a closed interval It was only comparatively recently that in this connection the general idea of a linear topological space L TS I was formed here the algebraic structure is compatible with the topological structure in the sense that the basic operations addition and multiplication by a scalar are continuous

Stochastic Processes and Functional Analysis Alan C. Krinik, Randall J. Swift, 2004-03-23 This extraordinary compilation is an expansion of the recent American Mathematical Society Special Session celebrating M M Rao s distinguished career and includes most of the presented papers as well as ancillary contributions from session invitees This book shows the effectiveness of abstract analysis for solving fundamental problems of stochas

Functional Analysis Methods in Numerical Analysis M. Z. Nashed, 2006-11-15

Functional Analysis V.S. Sunder, 1997 In an elegant and concise fashion this book presents the concepts of functional analysis required by students of mathematics and physics It begins with the basics of normed linear spaces and quickly proceeds to concentrate on Hilbert spaces specifically the spectral theorem for bounded as well as unbounded operators in separable Hilbert spaces While the first two chapters are devoted to basic propositions concerning normed vector spaces and Hilbert spaces the third chapter treats advanced topics which are perhaps not standard in a first course on functional analysis It begins with the Gelfand theory of commutative Banach algebras and proceeds to the Gelfand Naimark theorem on commutative C algebras A discussion of representations of C algebras follows and the final section of this chapter is devoted to the Hahn Hellinger classification of separable representations of commutative C algebras After this detour into operator algebras the fourth chapter reverts to more standard operator theory in Hilbert space dwelling on topics such as the spectral theorem for normal operators the polar decomposition theorem and the Fredholm theory for compact operators A brief introduction to the theory of unbounded operators on Hilbert space is given in the fifth and final chapter There is a voluminous appendix whose purpose is to fill in possible gaps in the reader s background in various areas such as linear algebra topology set theory and measure theory The book is interspersed with many exercises and hints are provided for the solutions to the more challenging of these

Geometric Aspects of Functional Analysis Bo'az Klartag, Emanuel Milman, 2020-06-20 Continuing the theme of the previous volumes these

seminar notes reflect general trends in the study of Geometric Aspects of Functional Analysis understood in a broad sense. Two classical topics represented are the Concentration of Measure Phenomenon in the Local Theory of Banach Spaces which has recently had triumphs in Random Matrix Theory and the Central Limit Theorem, one of the earliest examples of regularity and order in high dimensions. Central to the text is the study of the Poincaré and log Sobolev functional inequalities, their reverses and other inequalities in which a crucial role is often played by convexity assumptions such as Log Concavity. The concept and properties of Entropy form an important subject with Bourgain's slicing problem and its variants drawing much attention. Constructions related to Convexity Theory are proposed and revisited as well as inequalities that go beyond the Brunn-Minkowski theory. One of the major current research directions addressed is the identification of lower dimensional structures with remarkable properties in rather arbitrary high dimensional objects. In addition to functional analytic results, connections to Computer Science and to Differential Geometry are also discussed.
