Surface mount technology SMT is a mature technology SMT allows placement of more surface mount components SMC into smaller and tighter printed circuit board PCB areas This increased density means increased performance and power in smaller packaging systems and allows manufacturing of smaller and higher performance products at lower cost The advance of integrated circuit IC technology and the requirements of high density for high speed circuitry is driving the design of SMC to higher pin count and smaller package size In general the higher pin count and smaller package size are accomplished by reducing the bond pad size and spacing pitch on the chip level and the lead pin solder dimensions and pitch on the chip carrier module level The last few years have witnessed an explosive growth in the research and development efforts devoted to SMT as a direct result of the rapid growth of SMT and miniaturization Some examples are hand held lightweight video recorders that can take sharp pictures hand held lightweight devices that can track the worldwide package movements and portable computers with tiny yet powerful microprocessors and large memory capability that can fit into a briefcase or into the palm of your hand

Area Array Interconnection Handbook Karl J. Puttlitz, Paul A. Totta, 2012-12-06 Microelectronic packaging has been recognized as an important enabler for the solid state revolution in electronics which we have witnessed in the last third of the twentieth century Packaging has provided the necessary external wiring and interconnection capability for

transistors and integrated circuits while they have gone through their own spectacular revolution from discrete device to gigascale integration At IBM we are proud to have created the initial simple concept of flip chip with solder bump connections at a time when a better way was needed to boost the reliability and improve the manufacturability of semiconductors The basic design which was chosen for SLT Solid Logic Technology in the 1960s was easily extended to integrated circuits in the 70s and VLSI in the 80s and 90s Three I O bumps have grown to 3000 with even more anticipated for the future The package families have evolved from thick film SLT to thin film metallized ceramic to co fired multi layer ceramic A later family of ceramics with matching expansivity to silicon and copper internal wiring was developed as a predecessor of the chip interconnection revolution in copper multilevel submicron wiring Powerful server packages have been developed in which the combined chip and package copper wiring exceeds a kilometer All of this was achieved with the constant objective of minimizing circuit delays through short efficient interconnects
