Kessler, 2012-12-06 Distributed memory multiprocessing systems DMS such as Intel's hypercubes the Paragon Thinking Machine's CM 5 and the Meiko Computing Surface have rapidly gained user acceptance and promise to deliver the computing power required to solve the grand challenge problems of Science and Engineering These machines are relatively inexpensive to build and are potentially scalable to large numbers

of processors. However, they are difficult to program; the non-uniformity of the memory which makes local accesses much faster than the transfer of non-local data via message passing operations implies that the locality of algorithms must be exploited in order to achieve acceptable performance. The management of data with the twin goals of both spreading the computational workload and minimizing the delays caused when a processor has to wait for non-local data becomes of paramount importance. When a code is parallelized by hand, the programmer must distribute the program's work and data to the processors which will execute it. One of the common approaches to do so makes use of the regularity of most numerical computations. This is the so-called Single Program Multiple Data (SPMD) or data parallel model of computation. With this method, the data arrays in the original program are each distributed to the processors, establishing an ownership relation and computations defining a data item are performed by the processors owning the data.

Multithreaded Computer

Architecture: A Summary of the State of the Art Robert A. Iannucci, Guang R. Gao, Robert H. Halstead Jr., Burton Smith, 2012-12-06. Multithreaded computer architecture has emerged as one of the most promising and exciting avenues for the exploitation of parallelism. This new field represents the confluence of several independent research directions which have united over a common set of issues and techniques. Multithreading draws on recent advances in dataflow, RISC, compiling for fine-grained parallel execution and dynamic resource management. It offers the hope of dramatic performance increases through parallel execution for a broad spectrum of significant applications based on extensions to traditional approaches. Multithreaded Computer Architecture is divided into four parts reflecting four major perspectives on the topic. Part I provides the reader with basic background information, definitions and surveys of work which have in one way or another been pivotal in defining and shaping multithreading as an architectural discipline. Part II examines key elements of multithreading, highlighting the fundamental nature of latency and synchronization. This section presents clever techniques for hiding latency and supporting large synchronization name spaces. Part III looks at three major multithreaded systems, considering issues of machine organization and compilation strategy. Part IV concludes the volume with an analysis of multithreaded architectures, showcasing methodologies and actual measurements. Multithreaded Computer Architecture: A Summary of the State of the Art is an excellent reference source and may be used as a text for advanced courses on the subject.

Parallel Computing Works! Geoffrey C. Fox, Roy D. Williams, Giuseppe C. Messina, 2014-06-28. A clear illustration of how parallel computers can be successfully applied to large-scale scientific computations. This book demonstrates how a variety of applications in physics, biology, mathematics and other sciences were implemented on real parallel computers to produce new scientific results. It investigates issues of fine-grained parallelism relevant for future supercomputers with particular emphasis on hypercube architecture. The authors describe how they used an experimental approach to configure different massively parallel machines, design and implement basic system software and develop algorithms for frequently used mathematical computations. They also devise performance models, measure the

performance characteristics of several computers and create a high performance computing facility based exclusively on parallel computers By addressing all issues involved in scientific problem solving Parallel Computing Works provides valuable insight into computational science for large scale parallel architectures For those in the sciences the findings reveal the usefulness of an important experimental tool Anyone in supercomputing and related computational fields will gain a new perspective on the potential contributions of parallelism Includes over 30 full color illustrations

Design and Programming of Reconfigurable Mesh Based Many-cores Heiner Giefers, 2012 The paradigm shift towards many core parallelism is accompanied by two fundamental questions how should the many processors on a single die communicate to each other and what are suitable programming models for these novel architectures In this thesis the author tackles both questions by reviewing the reconfigurable mesh model of massively parallel computation for many cores The book presents the design implementation and evaluation of a many core architecture that is based on the execution principles and communication infrastructure of the reconfigurable mesh This work fundamentally rests on FPGA implementations and shows that reconfigurable mesh processors with hundreds of autonomous cores are feasible Several case studies demonstrate the effectiveness of programming and illustrate why the reconfigurable mesh is a promising model for many cores

PARLE '92, Parallel Architectures and Languages Europe Daniel Etiemble, 1992-06-03 The 1992 Parallel Architectures and Languages Europe conference continues the tradition of a wide and representative international meeting of specialists from academia and industry in theory design and application of parallel computer systems set by the previous PARLE conferences held in Eindhoven in 1987 1989 and 1991 This volume contains the 52 regular and 25 poster papers that were selected from 187 submitted papers for presentation and publication In addition five invited lectures are included The regular papers are organized into sections on implementation of parallel programs graph theory architecture optimal algorithms graph theory and performance parallel software components data base optimization and modeling data parallelism formal methods systolic approach functional programming fine grain parallelism Prolog data flow systems network efficiency parallel algorithms cache systems implementation of parallel languages parallel scheduling in data base systems semantic models parallel data base machines and language semantics

PARLE '93 Parallel Architectures and Languages Europe Arndt Bode, Mike Reeve, 1993-06-07 Parallel processing offers a solution to the problem of providing the processing power necessary to help understand and master the complexity of natural phenomena and engineering structures By taking several basic processing devices and connecting them together the potential exists of achieving a performance many times that of an individual device However building parallel application programs is today recognized as a highly complex activity requiring specialist skills and in depth knowledge PARLE is an international European based conference which focuses on the parallel processing subdomain of informatics and information technology It is intended to become THE European forum for interchange between experts in the parallel processing domain and to attract both industrial and

academic participants with a technical programme designed to provide a balance between theory and practice This volume contains the proceedings of PARLE 93 The PARLE conference came into existence in 1987 as an initiative from the ESPRIT I programme and the format was revised in 1991 92 PARLE 93 is the second conference with the new format and was held in Munich

Parallel Processing for Artificial Intelligence 1 L.N. Kanal,H. Kitano,V. Kumar,C.B. Suttner,2014-06-28 Parallel processing for AI problems is of great current interest because of its potential for alleviating the computational demands of AI procedures The articles in this book consider parallel processing for problems in several areas of artificial intelligence image processing knowledge representation in semantic networks production rules mechanization of logic constraint satisfaction parsing of natural language data filtering and data mining The publication is divided into six sections The first addresses parallel computing for processing and understanding images The second discusses parallel processing for semantic networks which are widely used means for representing knowledge methods which enable efficient and flexible processing of semantic networks are expected to have high utility for building large scale knowledge based systems The third section explores the automatic parallel execution of production systems which are used extensively in building rule based expert systems systems containing large numbers of rules are slow to execute and can significantly benefit from automatic parallel execution The exploitation of parallelism for the mechanization of logic is dealt with in the fourth section While sequential control aspects pose problems for the parallelization of production systems logic has a purely declarative interpretation which does not demand a particular evaluation strategy In this area therefore very large search spaces provide significant potential for parallelism In particular this is true for automated theorem proving The fifth section considers the problem of constraint satisfaction which is a useful abstraction of a number of important problems in AI and other fields of computer science It also discusses the technique of consistent labeling as a preprocessing step in the constraint satisfaction problem Section VI consists of two articles each on a different important topic The first discusses parallel formulation for the Tree Adjoining Grammar TAG which is a powerful formalism for describing natural languages The second examines the suitability of a parallel programming paradigm called Linda for solving problems in artificial intelligence Each of the areas discussed in the book holds many open problems but it is believed that parallel processing will form a key ingredient in achieving at least partial solutions It is hoped that the contributions sourced from experts around the world will inspire readers to take on these challenging areas of inquiry
