Legacy Of Cell Fusion:

The Black Box of Biology Michel Morange, 2020-06-09 In this masterful account a historian of science surveys the molecular biology revolution its origin and continuing impact Since the 1930s a molecular vision has been transforming biology Michel Morange provides an incisive and overarching history of this transformation from the early attempts to explain organisms by the structure of their chemical components to the birth and consolidation of genetics to the latest technologies and discoveries enabled by the new science of life Morange revisits *A History of Molecular Biology* and offers new insights from the past twenty years into his analysis *The Black Box of Biology* shows that what led to the incredible transformation of biology was not a simple accumulation of new results but the molecularization of a large part of biology In fact Morange argues the greatest biological achievements of the past few decades should still be understood within the molecular paradigm What has happened is not the displacement of molecular biology by other techniques and avenues of research but rather the fusion of molecular principles and concepts with those of other disciplines including genetics physics structural chemistry and computational biology This has produced decisive changes including the discoveries of regulatory RNAs the development of massive scientific programs such as human genome sequencing and the emergence of synthetic biology systems biology and epigenetics Original persuasive and breathtaking in its scope *The Black Box of Biology* sets a new standard for the history of the ongoing molecular revolution

The Legacy of Cell Fusion Siamon Gordon, 2023 This volume presents some of the important subjects opened up for experimental analysis by cell hybridization These include nuclear and cell interaction in heterokaryons The technique of artificial fusion of animal cells was invented by Henry Harris and his colleagues in 1965

Evolution by Tumor Neofunctionalization Andrei P. Kozlov, 2014-02-15 Evolution by Tumor Neofunctionalization explores the possibility of the positive role of tumors in evolution of multicellular organisms This unique perspective goes beyond recent publications on how evolution may influence tumors to consider the possible role of tumors in evolution Widespread in nature tumors represent a much broader category than malignant tumors only The majority of tumors in humans and other animals may never undergo malignant transformation Tumors may differentiate with the loss of malignancy and malignant tumors may spontaneously regress Cellular oncogenes and tumor suppressor genes play roles in normal development Many features of tumors could be used in evolution and there are examples of tumors that have played a role in evolution This book will stimulate thinking on this topic by specialists in the fields of evolutionary biology oncology molecular biology molecular evolution embryology evo devo tumor immunology pathology and clinical oncology Covers the role that tumors might play in evolution Provides multidisciplinary approach that will appeal to a wide circle of professionals in the fields of evolutionary biology oncology molecular biology and more

Adhesion-GPCRs Simon Yona, Martin Stacey, 2011-06-26 Upon completion of the human genome project over 800 G protein coupled receptor 1 GPCR genes subdivided into five categories were identified These receptors sense a diverse array of stimuli including peptides ions lipid analogues light and odour in a discriminating fashion Subsequently they transduce a signal from the ligand receptor complex into numerous cellular responses The importance of GPCRs is further reflected in the fact that they constitute the most common target for therapeutic drugs across a 2 wide range of human disorders Phylogenetic analysis of GPCRs produced the GRAFS classification system which subdivides GPCRs into five discrete families glutamate rhodopsin adhesion frizzled taste2 and secretin receptors The adhesion GPCR family 2 can be further subdivided into eight groups The field of adhesion GPCR biology has indeed become large enough to require a volume dedicated solely to this field The contributors to this book have made a courageous effort to address the key concepts of adhesion GPCR biology including the evolution and biochemistry of adhesion GPCRs there are extensive discussions on the functional nature of these receptors during development the immune response and tumourgenesis Finally there are chapters dedicated to adhesion GPCR signalling an area of intense investigation

Mobility and Proximity in Biological Membranes S. Damjanovich, 2018-01-18 Cell surface membranes have long been characterized as two dimensional fluids whose mobile components are randomized by diffusion in the plane of the membrane bilayer Recent research has indicated that cell surface membranes are highly organized and ordered and that

important functional units of membranes appear as arrays of interacting molecules rather than as single freely diffusing molecules. *Mobility and Proximity in Biological Membranes* provides an overview of the results obtained from biophysical methods for probing the organization of cell surface membranes. These results are presented in the context of detailed treatments of the theory and the technical demands of each of the methods. The book describes a versatile and easily applied mode for investigating molecular proximities in plasma membranes in a flow cytometer. Its analysis of lipid fluidity and viscosity of membranes and the rotational mobility of proteins offers intimate insight into the physical chemistry of biological membranes. The electrophysiology of lymphocytes is presented with focus on its importance in different diseases. New techniques are described and new data, new possibilities and future trends are presented by world experts. This book's chapters can serve both as guides to the existing literature and as starting points for new experiments and approaches associated with problems in membrane function.

The Cells of the Body Henry Harris, 1995. This book is the first scholarly history of research into the genetics of body cells from its origins in the 19th century to the present day. Henry Harris, a well known writer and a distinguished investigator in cell biology and cancer genetics, brings an unusually informed perspective to the technical aspects of his subject. He has written a book to be enjoyed not just by professional historians of science but by working scientists in genetics, cell biology and cancer research from the graduate student level upwards. Its readers will derive a richer understanding of how and why the cells of the body are studied in the way that they are today.

Membrane Permeability: 100 Years Since Ernest Overton, 1999-05-21. Membrane permeability is fundamental to all cell biology and subcellular biology. The cell exists as a closed unit. Import and export depend upon a number of sophisticated mechanisms such as active transport, endocytosis, exocytosis and passive diffusion. These systems are critical for the normal housekeeping physiological functions. However, access to the cell is also taken advantage of by toxic microbes such as cholera or ptomaine and when designing drugs. Ernest Overton, one of the pioneers in lipid membrane research, put forward the first comprehensive theory of lipid membrane structure. His most quoted paper on the osmotic properties of cells laid the foundation for the modern concepts of membrane function, most notably important in anesthesia. This book is designed to celebrate the centennial anniversary in the first chapter of Overton's work. Subsequent chapters present readers with up to date concepts of membrane structure and function and the challenge they pose for new explorations. Provides an historical perspective of Overton's contributions to the theory of narcosis. Presents an overview of each permeability mechanism including active transport, endocytosis, exocytosis and passive diffusion.

RNA/DNA and Cancer Joseph G. Sinkovics, 2016-04-01. In this book the author Joseph G. Sinkovics liberally shares his views on the cancer cell which he has been observing in vivo and in vitro over a life time. Readers will learn how, as an inherent faculty of the RNA/DNA complex, the primordial cell survival pathways are endogenously reactivated in an amplified or constitutive manner in the multicellular host and are either masquerading as self elements or as placentas to which the multicellular host is evolutionarily trained to

extend full support The host obliges The author explains that there is no such evidence that malignantly transformed human cells survive in nature However when cared for in the laboratory these cells live and replicate as immortalized cultures These cells retain their vitality upon storage in liquid nitrogen One can only imagine an astrophysical environment in which such cells could survive perhaps first their seemingly humble exosomes would populate that environment Immortal cell populations so created may survive as individuals or may even re organize themselves into multicellular colonies as representatives of life for the duration of the Universe This thought provoking book is the work of a disciplined investigator and clinician with an impeccable reputation and he enters a territory that very few if any before him have approached from the same angles It will appeal to researchers with an interest in cell survival pathways and those researching cancer cells
