Ergebnisse der Microbiologie und Immunitätsforschung W. Arber, W. Henle, P. H. Hofschneider, J. H. Humphrey, N. K. Jerne, P. Koldovský, H. Koprowski, O. Maaløe, R. Rott, H. G. Schweiger, M. Sela, L. Syru?ek, P. K. Vogt, 2012-12-06 Expression of an immune response is the net result of complex synergistic and antagonistic activities performed by a variety of cell types It includes macrophages T and B populations which may interact in performance of a response and suppressor cells interfering with it Accordingly a lack of response may not necessarily indicate absence of immunocompetent cells but rather nonexpression of competence Thus one should consider two possible situations which are by no means mutually exclusive to account for immunologic unresponsiveness a one or more of the cell populations composing the synergistic unit is absent or immature and b an antagonistic unit which interferes with the response is dominating In view of this an approach to development of immune reactivity necessitates parallel surveys of development of cells with the potential to perform as well as of cells which can suppress the response Classification of the various cell types has been based so far on their phenotypic properties e g membrane antigen markers cell receptors production and secretion of immunoglobulins etc Genotypically T and B cells may represent either separate independent cell lines or different stages of development within the same cell lineage

Insect immunity and its interactions with microorganisms and parasitoids Fengliang Jin, Erjun Ling, Yonggyun Kim, Zhen Zou, 2023-12-18 Insects are a group of abundant and diverse organisms that have successfully adapted to the most challenging conditions on earth The success of insects in adverse environments indicates the advanced defense mechanisms employed by these organisms but they are often targeted by specialized microorganisms viruses bacteria nematodes fungi and parasitoids Insects exhibit both humoral and cellular immune responses against pathogens The lack of an adaptive immune system has compelled insects to choose immediate non specific but sophisticated responses that include the production of antimicrobial peptides phenoloxidase apoptosis phagocytosis encapsulation and nodulation In recent decades technological advances have been made in decrypting the molecular and mechanistic basis of insect immunity However there is a need to understand the insect immune responses to single or mixed encounters Future challenges include a better understanding of functional cooperation of various endosymbiotic microbes and their role in insect defenses Post transcriptional modulation of immune responses regulated by non coding RNAs microRNA long non coding RNAs has become critically important to study by using modern bioinformatics and experimental tools Therefore investigating the dynamics of insect immune responses will substantially increase the capacity for confronting harmful agricultural and medical pests Furthermore most insect cellular immune activities have been conducted in a laboratory setting therefore confirming the existing knowledge in a natural environment would provide crucial information **Current Topics in Microbiology and Immunology** M.
