## Homeomorphy In Recent Deep Sea Brachiopo:

*Recent Antarctic and Subantarctic Brachiopods* Merrill W. Foster, 1974 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 21 The Recent brachiopod faunas from southernmost South America Antarctica and the Subantarctic consisting of 21 genera and 37 species are described from new material New taxa include the genera *Manithyris* and *Bathynanus* Also new are 11 species *Compsothyris ballenyi* *Hispanirhynchia chiliensis* *Manithyris rossi* *Liothyrella multiporosa* *Liothyrella scotti* *Bathynanus tenuicostatus* *Eucalathis macrorhynchus* *Amphithyris hallettensis* *Dallina eltanini* *Fallax antarcticus* and *Magellania spinosa* Factor analysis was used to study relationships among morphological characters and environmental parameters In *Liothyrella* negative associations were found between beak height and water depth The size of the pedicle opening within this genus is associated with the width of the hinge plate and the loop apparently these associations are related to increased dorsal adductor muscle size with increased pedicle size Similar relationships are found in the terebratulids although here all of the characters are also negatively associated with water depth Characters negatively associated with water depth may relate to the differing current strength at various depths Puncta density is positively correlated with water temperature Examples of brachiopod variation are discussed Synonyms have resulted from former failure to study large samples and to appreciate the extent of brachiopod variation A priori valuation of certain characters as being specific is unwarranted since sibling species may be more similar than different subspecies of the same species Many Recent and fossil brachiopod genera are too narrow in definition owing to oversplitting or to a narrow conception of monophyly I advocate somewhat broader and more practical genera for obtaining the maximal information value from such taxa Brachiopods contrary to popular belief are an abundant and viable group in the southern hemisphere faunas Most brachiopods in the Ross Sea appear to have definite niches and habitats but may overlap geographically where population densities are low Brachiopods here can be divided roughly into a slope and a shelf assemblage The greatest species diversity occurs at the seaward edge of the Ross Sea shelf interpreted as an ecotone effect where two different water types meet Only South America and Antarctica appear to have or have had direct communication between some elements of their brachiopod faunas Other similarities between separate southern continents are related to retention of common pre Cenozoic elements or to chance dispersal of larvae across barriers Events related to cooling during the late Pliocene or Pleistocene caused reduction of puncta density shell thickness and spiculation in the Recent fauna and apparently influenced the present species structure at least in *Liothyrella uva* *Gyrothyris mawsoni* and *Macandrevia* *New Zealand Journal of Zoology*, 1981 *Journal of the Royal Society of New Zealand*, *Brachiopods* Paul Copper, 2018-02-02 This collection of conference papers presents information on the molecular genetics biomineralization growth and ecology of extant brachiopod stocks extrapolated back to the Cambrian and the shell microstructure taphonomy paleogeography evolution and taxonomy of fossil brachiopods **New Brachiopods from the Southern Hemisphere and Cryptopora**

Doescher, Smithsonian Institution, Clayton Edward Ray, 1969 Taxonomic Atlas of the Benthic Fauna of the Santa Maria Basin and Western Santa Barbara Channel: Miscellaneous taxa Andrew L. Lissner, 1996 *Marine Biodiversity of Costa Rica, Central America* Ingo S. Wehrtmann, Jorge Cortés, 2008-12-28 Life began in the sea and even today most of the deep diversity of the planet is marine This is often forgotten especially in tropical countries like Costa Rica renowned for their rain forests and the multitude of life forms found therein Thus this book focusing on marine diversity of Costa Rica is particularly welcome How many marine species are there in Costa Rica The authors report a total of 6 777 species or 3 5% of the world's total Yet the vast majority of marine species have yet to be formally described Recent estimates of the numbers of species on coral reefs range from 1 9 million so that the true number of marine species in Costa Rica is certainly far higher In some groups the numbers are likely to be vastly higher because to date they have been so little studied Only one species of nematode is reported despite the fact that it has been said that nematodes are the most diverse of all marine groups In better studied groups such as mollusks and crustaceans reported numbers are in the thousands but even in these groups many species remain to be described Indeed the task of describing marine species is daunting if there really are about 9 million marine species and Costa Rica has 3 5% of them then the total number would be over 300 000 Clearly so much remains to be done that new approaches are needed Genetic methods have enormous promise in this regard *Brachiopods from the Caribbean Sea and Adjacent Waters* Gustav Arthur Cooper, 1975 Brachiopoda from the Southern Indian Ocean (recent) Gustav Arthur Cooper, 1981 Specimens collected from 120 stations around and between the subantarctic islands Marion Prince Edward Crozet Kerguelen Heard Amsterdam and St Paul by the M S Marion Dufresne with the support of Terres Australes et Antarctiques Françaises Paris greatly increase our knowledge of the brachiopoda of the Indian Ocean Eighteen species are recognized that include 16 genera 2 of them new Pemphixina and Xenobrochus 11 new species Basiliola arnaudi Eucalathis magna E costellata E rotundata Xenobrochus australis X anomalus Dallithyris dubia Dyscolia radiata Platidia marionensis Ecnomiosa inexpectata and Thecidellina minuta Seven hitherto described species are recorded Pelagodiscus atlanticus King Pemphixina pyxidata Davidson Liothyrella moseleyi Davidson Megerlina davidsoni Vlaminck Megerlia gigantea Deshayes Aerothyris kerguelenensis Davidson and Aff A macquariensis Thomson Six genera which could not be identified specifically were also taken Crania Basiliola Tegulorhynchia Eucalathis Liothyrella and Aerothyris Genera recognized in the Indian Ocean for the first time are Tegulorhynchia Basiliola and Ecnomiosa the last hitherto known only from the Gulf of Mexico and Caribbean Sea
