High Level Vlsi Synthesis:

High-Level VLSI Synthesis Raul Camposano, Wayne Wolf, 2012-12-06 The time has come for high level synthesis When research into synthesizing hardware from abstract program like descriptions started in the early 1970 s there was no automated path from the register transfer design produced by high level synthesis to a complete hardware implementation As a result it was very difficult to measure the effectiveness of high level synthesis methods it was also hard to justify to users the need to automate architecture design when low level design had to be completed manually Today s more mature CAD techniques help close the gap between an automatically synthesized design and a manufacturable design Market pressures encourage designers to make use of any and all automated tools Layout synthesis logic synthesis and specialized datapath generators make it feasible to quickly implement a register transfer design in silicon leaving designers more time to consider architectural improvements As IC design becomes more automated customers are increasing their demands today s leading edge designers using logic synthesis systems are training themselves to be tomorrow s consumers of high level synthesis systems The need for very fast turnaround a competitive fabrication market Which makes small quantity ASIC manufacturing possible and the ever growing complexity of the systems being designed all make higher level design automation inevitable

High — Level Synthesis Daniel D. Gajski, Nikil D. Dutt, Allen C-H Wu, Steve Y-L Lin, 2012-12-06 Research on high level synthesis started over twenty years ago but lower level tools were not available to seriously support the insertion of high level synthesis into the mainstream design methodology Since then substantial progress has been made in formulating and understanding the basic concepts in high level synthesis Although many open problems remain high level synthesis has matured High Level Synthesis Introduction to Chip and System Design presents a summary of the basic concepts and results and defines the remaining open problems This is the first textbook on high level synthesis and includes the basic concepts the main algorithms used in high level synthesis and a discussion of the requirements and essential issues for high level synthesis systems and environments A reference text like this will allow the high level synthesis community to grow and prosper in the future High Level VLSI Synthesis for Multichip Designs Nand Kumar, 1994 Theorem Proving in Higher

Architecture Design and Validation Methods Egon Börger, 2012-12-06 This book grew out of material which was taught at the International Summer School on Architecture Design and Validation Methods held June 23 July 5 1997 on the Island of Lipari and directed to graduate students and young researchers Since then the course notes have been completely elaborated and extended and additional

chapters have been added so that this book offers a comprehensive presentation of the state of the art which leads the reader to the forefront of the current research in the area. The chapters, each of which was written by a group of eminent specialists in the field, are self-contained and can be read independently of each other. They cover the wide range of theoretical and practical methods which are currently used for the specification, design, validation, and verification of hardware, software, architectures, and synthesis methods. The subject of the first three chapters is the chapter on Modeling and Synthesis of Behavior, Control, and Data Flow, which focusses on techniques above the register transfer level. The chapter on Cell-Based Logic Optimizations concentrates on methods that interface logic design with physical design, in particular on techniques for cell library binding, the back end of logic synthesis. The chapter on A Design Flow for Performance Planning presents new paradigms for iteration-free synthesis, where global wire plans for meeting timing constraints already appear at the conceptual design stage, even before fixing the functionality of the blocks in the plan.

Electronic Design Automation for IC Implementation, Circuit Design, and Process Technology Luciano Lavagno, Igor L. Markov, Grant Martin, Louis K. Scheffer, 2017-02-03. The second of two volumes in the Electronic Design Automation for Integrated Circuits Handbook, Second Edition. Electronic Design Automation for IC Implementation, Circuit Design, and Process Technology thoroughly examines real-time logic (RTL) to GDSII, a file format used to transfer data of semiconductor physical layout design flow, analog, mixed-signal design, physical verification, and technology computer-aided design (TCAD). Chapters contributed by leading experts authoritatively discuss design for manufacturability (DFM), at the nanoscale power supply network design and analysis, design modeling, and much more. New to This Edition: Major updates appearing in the initial phases of the design flow, where the level of abstraction keeps rising to support more functionality with lower non-recurring engineering (NRE) costs. Significant revisions reflected in the final phases of the design flow, where the complexity due to smaller and smaller geometries is compounded by the slow progress of shorter wavelength lithography. New coverage of cutting-edge applications and approaches realized in the decade since publication of the previous edition; these are illustrated by new chapters on 3D circuit integration and clock design. Offering improved depth and modernity. Electronic Design Automation for IC Implementation, Circuit Design, and Process Technology provides a valuable state-of-the-art reference for electronic design automation (EDA) students, researchers, and professionals.

The SECD Microprocessor Brian T. Graham, 2012-12-06. This is a milestone in machine-assisted microprocessor verification. Gordon and Hunt led the way with their verifications of simple designs. Cohn followed this with the verification of parts of the VIPER microprocessor. This work illustrates how much these and other pioneers achieved in developing tractable models, scalable tools, and a robust methodology. A condensed review of previous research, emphasizing the behavioural model underlying this style of verification, is followed by a careful and remarkably readable account of the SECD architecture, its formalisation, and a report on the organisation and execution of the automated correctness proof in

HOL This monograph reports on Graham's MSc project demonstrating that in the right hands the tools and methodology for formal verification can and therefore should now be applied by someone with little previous expertise in formal methods to verify a non-trivial microprocessor in a limited timescale. This is not to belittle Graham's achievement: the production of this proof working as Graham did from the previous literature goes well beyond a typical MSc project. The achievement is that with this exposition to hand an engineer tackling the verification of similar microprocessor designs will have a clear view of the milestones that must be passed on the way and of the methods to be applied to achieve them.

Artificial Intelligence and Automation Nikolaos G. Bourbakis, 1998 **Computer Aided Systems Theory - EUROCAST '91** Franz

Pichler, Roberto Moreno Diaz, 1992-04-08 This volume contains a selection of papers presented at the second European workshop EUROCAST 91 held in Krems Austria in April 1991. It gives an overview of the current state of Computer Aided Systems Theory research and its relation to CAD applications in the engineering fields. CAST research requires the application of the most advanced information processing technology in software and hardware for the implementation of CAST method base systems. Engineers in the field of information and control engineering have the opportunity in CAST to present the state of the art in modeling tools to computer scientists. EUROCAST 91 proved that CAST research is still in an early state of development. The papers in the volume are organized into sections on systems theory and CAST methodology modeling environments CAST method base systems and artificial vision and information and control systems.

Embedded Software and Systems Zhaohui Wu, Minyi Guo, Chun Chen, Jiajun Bu, 2005-08-29 Welcome to the post-proceedings of the First International Conference on Embedded Software and Systems ICESS 2004 which was held in Hangzhou P.R. China 9-10 December 2004. Embedded Software and Systems technology is of increasing importance for a wide range of industrial areas such as aerospace, automotive, telecommunication and manufacturing automation. Embedded technology is playing an increasingly dominant role in modern society. This is a natural outcome of amazingly fast developments in the embedded field. The ICESS 2004 conference brought together researchers and developers from academia, industry and government to advance the science, engineering and technology in embedded software and systems development and provided them with a forum to present and exchange their ideas, results, work in progress and experience in all areas of embedded systems research and development. The ICESS 2004 conference attracted much more interest than expected. The total number of paper submissions to the main conference and its three workshops, namely Pervasive Computing, Automobile Electronics and Telecommunication, was almost 400 from nearly 20 countries and regions. All submissions were reviewed by at least three Program or Technical Committee members or external reviewers. It was extremely difficult to make the final decision on paper acceptance because there were so many excellent, foreseeing and interesting submissions with brilliant ideas.
