**Evolution of the Human Diet** Peter S. Ungar, 2007 We are interested in the evolution of hominin diets for several reasons One is the fundamental concern over our present day eating habits and the consequences of our societal choices such as obesity prevalent in some cultures and starvation in others Another is that humans have learned to feed themselves in extremely varied environments and these adaptations which are fundamentally different from those of our closest biological relatives have to have had historical roots of varying depth The third and the reason why most paleoanthropologists are interested in this question is that a species trophic level and feeding adaptations can have a strong effect on body size locomotion life history strategies geographic range habitat choice and social behavior Diet is key to understanding the ecology and evolution of our distant ancestors and their kin the early hominins A study of the range of foods eaten by our progenitors underscores just how unhealthy many of our diets are today This volume brings together authorities from disparate fields to offer new insights into the diets of our ancestors Paleontologists archaeologists primatologists nutritionists and other researchers all contribute pieces to the puzzle This volume has at its core four main sections Reconstructed diets based on hominin fossils tooth size shape structure wear and chemistry mandibular biomechanics Archaeological evidence of subsistence stone tools and modified bones Models of early hominin diets based on the diets of living primates both human and non human paleoecology and energetics Nutritional analyses and their implications for evolutionary medicine New techniques for gleaning information from fossil teeth bones and stone tools new theories stemming from studies of paleoecology and new models coming from analogy with modern humans and other primates all contribute to our understanding When these approaches are brought together they offer an impressive glimpse into the lives of our distant ancestors The contributions in this volume explore the frontiers of our knowledge in each of these disciplines as they address the knowns the unknowns and the unknowables of the evolution of hominin diets

**Human Physical Fitness and Activity** Ann E. Caldwell, 2016-03-29 The science of human physical activity and fitness is ripe for a novel theoretical framework that can integrate the ecological genetic physiological and psychological factors that influence physical activity in humans Physical inactivity dominates most developed nations around the world and is among the leading causes of disease burden and death worldwide Despite the wide array of physical and mental health benefits few people get the recommended level of physical activity to achieve these benefits Current research on physical activity has not as of yet been successful for the development of effective exercise interventions Several researchers have advocated a more integrative approach that takes evolutionary history into account but such a framework has yet to be advanced To that aim the first goal of this book is to present a comprehensive evolutionary and life history framework that highlights the domain specific aspects of the evolved psychology and physiology that can lead to a more integrated and complete understanding of physical activity across the lifespan It summarizes and extends previous work that has been done to understand the ways natural selection has shaped physical activity in humans in traditional and modern economies and environments In many ways humans are adapted to be physically active Overall however natural selection has shaped a flexible but energy conscious system that responds to environmental and individual costs and benefits of physical activity to optimally allocate a finite energetic budget across the lifespan This system is adapted to respond to cues of resource scarcity and high levels of obligatory physical activity and conserves energy to favor allocation in ways that increase the likelihood of reproductive success and survival This nuanced application leads to a more thorough understanding of the circumstances that natural selection is predicted to favor both

sedentary and active behaviors in predictable ways across the lifespan The second goal of this book is to synthesize and interpret cross disciplinary research from biological and evolutionary anthropology and psychology epidemiology health psychology and exercise physiology that can illuminate original approaches to increase physical activity in modern primarily sedentary contexts This includes a breakdown of the human lifespan to discuss the predicted costs and benefits of physical activity at each stage of life in order to differentiate the obstacles to physical activity and exercise that are functionally adaptive or were in the environments that they evolved and identifying which factors are more modifiable than others in order to develop interventions and environments that are more conducive to physical activity

Aird,2007-09-03 The endothelium the cell layer that forms the inner lining of blood vessels is a spatially distributed system that extends to all areas of the human body Clinical and basic research demonstrates that the endothelium plays a crucial role in mediating homeostasis and is involved in virtually every disease either as a primary determinant of pathophysiology or as a victim of collateral damage The endothelium has remarkable though largely untapped diagnostic and therapeutic potential This volume bridges the bench to bedside gap in endothelial biomedicine advancing research and development and improving human health The book is the first to systematically integrate knowledge about the endothelium from different organ specific disciplines including neurology pulmonary cardiology gastroenterology rheumatology infectious disease hematology oncology nephrology and dermatology It s interdisciplinary approach which draws on expertise from such diverse fields as evolutionary biology comparative biology molecular and cell biology mathematical modeling and complexity theory translational research and clinical medicine      Changes 1 Teacher's Book Jack C. psychological disorder in our modern worlds i.e. mismatch among which epidemics of autoimmune diseases cardiovascular diseases diabetes and obesity as well as several forms of cancer stand out One could add depression anxiety and other psychiatric conditions to the list The Oxford Handbook of Evolutionary Medicine is a compilation of up to date insights into the evolutionary history of ourselves as a species exploring how and why our evolved design may convey vulnerability to disease Written in a classic textbook style emphasising physiology and pathophysiology of all major organ systems the Oxford Handbook of Evolutionary Medicine is valuable reading for students as well as scholars in the fields of medicine biology anthropology and psychology

**Evolutionary Aspects of Nutrition and Health** Artemis P. Simopoulos, 1999-01-01 The issues treated in this publication are brought together in this way for the first time For many of the chronic diseases familial predispositions are well established and there is good evidence for true genetic predisposition When *Homo erectus* emerged 1.7 million years ago humans existed as non cereal eating hunter gatherers It is on this basis that according to the hypothesis of the carnivore connection an insulin resistant genotype evolved to provide survival and reproductive advantages to populations adapted to a high meat low plant food low carbohydrate nutritional environment Cereal became the major source of calories and protein in the human diet only about 10 000 years ago Humankind has thus had little evolutionary experience to adapt to this new food type maladaptation being the consequence Moreover studies comparing energy expenditure in Western societies and during the Paleolithic period indicate a low level of physical activity not previously encountered in human history a state to which humans are not genetically adapted Together with the dietary changes this has led to a modern environment in which a number of individuals are prone to chronic diseases causing increases in non insulin dependent diabetes mellitus hypertension coronary artery disease cancer and obesity As a consequence the lifestyle approach for the prevention and management of these diseases is essential varying with national dietary patterns and national economy This publication will be of special interest to physicians geneticists nutritionists dieticians anthropologists food technologists food policy makers and individuals interested in personal and family health
