Quintard, Jean-Christophe Orban, 2017-12-30 The purpose of this book is to bring together the latest findings on metabolic disorders that are strongly implicated in various critically ill patients Since the beginning of the 20th century maintaining the milieu intérieur has been a major challenge for intensivists In addition to considerable technological developments in intensive care units important advances in our understanding of metabolic disorders observed in critically ill patients have been made during the 10 last years Today the intensivist can't ignore these disorders when selecting the most appropriate treatment for an illness Cellular metabolic abnormalities are responsible for systems and organ failures so the modern approach of organ dysfunctions now includes prevention or treatment of such disorders This book is a comprehensive tool allowing the physician to understand diagnose and treat these metabolic disorders Water electrolyte acid base glycemic and endocrinologic problems as well as metabolic abnormalities observed in renal cerebral and hepatic failure are presented in different chapters The last part of the book is devoted to modern nutritional concepts the consequences of energy modifications mitochondrial dysfunction hypothermia oxidative stress and ischemia reperfusion which open the way for new therapies Metabolism and Artificial Nutrition in the Critically Ill G. Guarnieri, F. Iscra, 2012-12-06 The critically ill patient in intensive care may present with serious metabolic alterations caused directly by the illness or secondarily by complications

e.g. infections, organ failure or sepsis developing within a few hours of hospitalization or in the following days. Among the situations which maintain and further trigger rapidly evolving altered metabolism are complex hormonal reactions, particularly those of the hypothalamus-hypophysis-adrenal axis and abnormal stimulation of the autonomic nervous system. In fact, the sympathetic nervous system is known to cause significant metabolic alterations. For example, a surgery patient afflicted by septic complications may become hypercatabolic and experience significant nitrogen loss; the altered protein metabolism may in turn heavily influence carbohydrate and lipid metabolism as well. Thus, it is apparent that for optimal care of patients with altered metabolic functions, further knowledge is necessary regarding the physiopathology of metabolism and the physiopathological mechanisms which alter the consumption of principal energy substrates. Many experimental and clinical studies have investigated the metabolic aspects of individual organs or organ systems. However, for a correct evaluation of such metabolic events, in addition to studying the roles of metabolic enzymes, active metabolites and the glutathione system, it is interesting to consider the use of indirect calorimetry as a valid and important investigative technique. The critically ill patient with major alterations in nutritional status may require artificial nutritive support administered through either parenteral or enteral routes.

The Stress Response of Critical Illness: Metabolic and Hormonal Aspects Jean-Charles Preiser, 2016-03-24. This book demonstrates how the latest insights into the physiopathology of the stress response can be integrated into clinical practice. The topic is particularly relevant since the metabolic changes triggered by acute stress, including adaptive responses such as resistance to anabolic signals, have

recently been more precisely delineated The underlying mechanisms of these changes are also now better understood The authors analyse how these advances could result in better management and more effective prevention of the long term clinical consequences of the alterations occurring during the acute phase An international panel of respected experts discusses these topics and describes the management of some common clinical conditions
