Between Two Worlds Lynton Keith Caldwell, 1992-01-23 The focus of this book is on changes in the human situation wrought by unprecedented changes in science based technology and expanding populations Increasing scientific information concerning these changes and their consequences is beginning to alter people's perceptions thus providing a rational basis for a worldwide environmental movement This movement complex and differentiated works through political and educational

means to establish new social priorities consistent with scientific findings and the sustainability of life on Earth. The success of this effort would signify a new phase of social development. The thesis of this book is that human made changes in the condition of the Earth accompanied by the changing attitudes and values implicit in the environmental movement constitute an historical discontinuity. The present era represents a transition between the assumptions and conditions that have hitherto characterized the modern world and those of the post modern world that is emerging. Science and technology so vividly symbolized in the view from outer space are fundamentally changing our traditional beliefs about human opportunities and limitations and these changes are slowly being reflected in international policies and laws. If humanity today succeeds in establishing a sustainable relationship to Earth a higher level of civilisation will have been achieved. This thought provoking view will interest students and professionals in the science and politics of the environment.

Systems and Models Hartmut Bossel, 2007. A multitude of complex systems and actors pursuing their own agenda shape the dynamics of our world. Better understanding of their actions and interactions is crucial and can be achieved by a profound knowledge of systems and their properties and their representation in models allowing simulation of probable behavior. Drawing on his extensive research and teaching experience in modeling and simulation of a wide range of systems from engineering to social systems and ecosystems the author presents the fundamental concepts and approaches for understanding and modeling the complex systems shaping the dynamics of our world. The book applies state space analysis and system dynamics to deal with the dynamic processes of causal systems, discusses information processing approaches for modeling decision processes of actors and agents and uses aspects of the coevolutionary development of systems in their environment to deal with normative orientation, ethics and evaluation of policies and long term development. The concepts are applied in particular to the issue of sustainable development of human society in an evolving world. The book is complemented by a survey of system topics and of models from many fields and by an extensive bibliography on the many systems related subjects covered. Hartmut Bossel is Professor Emeritus of environmental systems analysis. He taught for many years at the University of California in Santa Barbara and the University of Kassel, Germany where he was director of the Center for Environmental Systems Research until his retirement. He holds an engineering degree from the Technical University of Darmstadt and a Ph D degree from the University of California at Berkeley. With a background in engineering, systems science and mathematical modeling he has led many research projects and future studies in different countries developing computer simulation models and decision support systems in the areas of energy supply, policy, global dynamics, orientation of behavior, agricultural policy and forest dynamics and management. He has written numerous books on modeling and simulation of dynamic systems, social change and future paths and has published widely in the scientific literature in several fields. Bossel is author of a *System Zoo* containing over one hundred simulation models of diverse systems.

Bioremediation and Natural Attenuation Pedro J. Alvarez, Walter A. Illman, 2005-12-16. A groundbreaking text and professional resource on natural attenuation technology.

Natural attenuation is rapidly becoming a widely used approach to manage groundwater and soil contamination by hazardous substances in petroleum product releases and leachate from hazardous waste sites and landfills. This book provides under one cover the current methodologies needed by groundwater scientists and engineers in their efforts to evaluate subsurface contamination problems to estimate risk to human health and ecosystems through mathematical models and to design and formulate appropriate remediation strategies. Incorporating the authors' extensive backgrounds as educators, researchers, and consultants in environmental biotechnology and hydrogeology, the text emphasizes new concepts and recent advances in the science, including: Quantification of the role of microbes in natural attenuation; Biodegradation and chemical transformation principles; Immobilization and phase change; Biotransformation mechanisms; Groundwater flow and contaminant transport; Analytical models for contaminant transport and reaction processes; Numerical modeling of contaminant transport, transformation, and degradation. Detailed descriptions of fundamental processes, characterization approaches, and analytical and numerical methods tied to relevant real-world applications make *Bioremediation and Natural Attenuation: Process Fundamentals and Mathematical Models* both a timely course text in hydrogeology and environmental engineering and a valuable reference for anyone in the groundwater or risk assessment professions.

Information Systems in the Political World K. V. Andersen, 1995. This text investigates the nature of impacts of information systems on the political world in the First World countries. The overall aim is to provide a framework on how to analyze implications of information technology (IT) on the political world and vice versa. This is illustrated by a study of economic modelling at the central and local levels of government.

Analytical Methods for Dynamic Modelers Hazhir Rahmandad, Rogelio Oliva, Nathaniel D. Osgood, 2015-11-13. A user-friendly introduction to some of the most useful analytical tools for model building, estimation, and analysis, presenting key methods and examples. Simulation modeling is increasingly integrated into research and policy analysis of complex sociotechnical systems in a variety of domains. Model-based analysis and policy design inform a range of applications in fields from economics to engineering to health care. This book offers a hands-on introduction to key analytical methods for dynamic modeling. Bringing together tools and methodologies from fields as diverse as computational statistics, econometrics, and operations research in a single text, the book can be used for graduate-level courses and as a reference for dynamic modelers who want to expand their methodological toolbox. The focus is on quantitative techniques for use by dynamic modelers during model construction and analysis, and the material presented is accessible to readers with a background in college-level calculus and statistics. Each chapter describes a key method, presenting an introduction that emphasizes the basic intuition behind each method, tutorial-style examples, references to key literature, and exercises. The chapter authors are all experts in the tools and methods they present. The book covers estimation of model parameters using quantitative data, understanding the links between model structure and its behavior, and decision support and optimization. An online appendix offers computer code for applications, models, and solutions to exercises.

The Rush to Policy Peter William House, Roger Don Shull, Rush to Policy explores the appropriate role of technical analysis in policy formulation. The authors ask when and how the use of sophisticated analytic techniques in decision making benefits the nation. They argue that these techniques are too often used in situations where they may not be needed or understood by the decision maker where they may not be to answer the questions raised but are nonetheless required by law. House and Shull provide an excellent empirical base for describing the impact of politics on policy analysis and policy analysts. They examine cost-benefit analysis, risk analysis and decision analysis and assess their ability to substitute for the current decision making process in the public sector. They examine the political basis of public sector decision making, how individuals and organizations make decisions and the ways decisions are made in the federal sector. Also they discuss the mandate to use these methods in the policy formulation process. The book is written by two practicing federal policy analysts who in a decade of service as policy researchers developed sophisticated quantitative analytic and decision making techniques. They then spent several years trying to use them in the real world. Success and failures are described in illuminating detail providing insight not commonly found in such critiques. The authors delineate the interaction of politics and technical issues. Their book describes policy analysis as it is not how it ought to be. Peter W. House is the director of policy research and analysis at the National Science Foundation. He is the author of ten books on multidisciplinary science and technology policy research and analyses in government, private and university sectors including *The Art of Public Policy Analysis* and with Roger D. Shull *Regulatory Reform: Politics and the Environment* and *Regulations and Science Management of Research on Demand*. Roger D. Shull is a senior analyst at the Division of Policy Research and Analysis, National Science Foundation.

A World In Transition: Humankind and Nature Diederik Aerts, Jan Broekaert, Willy Weyns, 2012-12-06. *A World in Transition: Humankind and Nature* is appropriately entitled after its aim for an intrinsic property of reality: change. Of major concern in this era of transformation is the extensive and profound interaction of humankind with nature. The global scale social and technological project of humankind definitely involves a myriad of changes of the ecosphere. This book develops from the call for an interdisciplinary synthesis and respect of plurality, acknowledging the evolving scientific truth to the need for an integrated but inevitably provisional worldview. Contributors from different parts of the world focus on four modes of change: i) Social change and the individual condition; ii) Complex evolution and fundamental emergent transformations; iii) Ecological transformation and responsibility inquiries; iv) The economic, ecological and socio-technical equilibria. Primarily concerned with the deep transformations of humankind and of the relationship between humans and nature, it is addressed to a broad and thinking public that wants to be kept informed.

Construction Economics Danny Myers,2004 Students across a wide range of disciplines ranging from construction management and construction engineering through to architecture property and surveying should find this an invaluable textbook The Bet Paul Sabin,2013-09-03 The Bet uses a legendary wager between the Stanford biologist Paul Ehrlich and the conservative University of Illinois economist Julian Simon to examine the roots of modern environmentalism and its relationship to broader political conflicts in the nation Ehrlich author of the landmark 1968 book The Population Bomb believed that rising populations would cause overconsumption scarcity and disastrous famines Simon countered that flexible markets technological change and human ingenuity would allow societies to adapt to changing circumstances and continue to improve human welfare In 1980 they made a much ballyhooed bet about the future prices of five metals that served as a proxy for their arguments about the future The Bet weaves intellectual biographies of Ehrlich and Simon into the history of late twentieth century environmental politics and other struggles of the era between liberals and conservatives Humanity s larger gamble on the future still remains unresolved By wrestling with the different sides of these arguments The Bet encourages a more nuanced approach to environmental problems one that acknowledges the limitations of both ecology and economics in guiding policy and that instead emphasizes the conflicting values that underlie political choices The Bet is structured around three bets first the 1000 bet that Ehrlich and two colleagues made with Simon over the prices of chromium copper nickel tin and tungsten second the bet that the United States faced in the 1980 presidential election in choosing between Carter and Reagan and third the larger gamble that we as a society continue to make as we make choices
