Liver Radioembolization with 90Y Microspheres José Ignacio Bilbao, Maximilian F

Reiser,2009-10-22 Percutaneous tumor ablation techniques are now well established in the curative or palliative treatment of patients with primary or secondary malignant tumors of the liver Radioembolization is a newly developed technique which takes advantage of the synergy of endovascular embolization and of brachytherapy in the treatment of cancer It offers new perspectives for achieving local control of tumor growth with a low rate of complications This book is the result of an intensive and successful collaboration between two leading European centers in interventional radiological oncology which have rapidly acquired extensive experience with this new technique over the past few years I am very much indebted to the editors Professor Bilbao and Professor M Reiser for their superb efforts in putting together the concept and outline of this volume as well as for the very short preparation time needed for its final publication I thank them and the collaborators from their team who actively participated in the compilation of the various chapters for their excellent work This outstanding volume covers all basic and clinical aspects of radioembolization of the liver very comprehensively Thus it offers a complete practical guide to interventional radiologists wishing to become familiar with this highly interesting approach to the treatment of malignant liver tumors It will undoubtedly be of great interest also to therapeutic radiologists medical oncologists and oncological surgeons since it will enable them to better design the optimal treatment strategy for their patients

Abdominal and Pelvic MRI A. Heuck, M. Reiser, 2012-12-09 While MRI has proved itself to be an excellent diagnostic noninvasive modality for imaging of the brain medulla and musculoskeletal system due to its high intrinsic contrast resolution and tissue characterisation potential based on the judicious application of specific sequences this has not been the case in the abdomen and pelvis The reasons are the long exposure time and the lower spatial resolution inherent to MRI However during recent years considerable progress has been achieved in MRI of the abdominal and pelvic organs due to the development of new and more rapid imaging sequences and the routine clinical application of specific magnetic resonance contrast media Consequently for some anatomical areas such as the female genital organs and the biliary system MRI is already the best performing morphological diagnostic modality However the question arises as to whether MRI given its performance capabilities should not also be considered a primary diagnostic modality for the study of parenchymal organs like the liver spleen and pancreas and not merely as a complementary modality to solve residual problems after ultrasonography and computed tomography have been performed Although the future role of MRI in respect of the gastrointestinal tube itself is still somewhat unclear some possibilities for routine clinical use are becoming visible even in this abdominal field
