

The tongue is covered with bumps called **papillae**.

Each papilla contains multiple **taste buds**.

Taste buds are filled with **gustatory cells** - the cells that do the tasting. The tip of each gustatory cell protrudes through a pore on the surface of the tongue.

Nerves carry signals from the gustatory cells to the brain.

The tip of each gustatory cell is covered with an assortment of **bitter taste receptors**, which can detect a wide variety of compounds. Stimulation of any of these receptors sends a signal to the brain: bitter!

Population Genetics: Donald P. Doolittle, 2012-12-06 I have for a number of years taught a course in population genetics for students interested in plant and animal breeding The objective of the course has been to lay a foundation in population genetics for the concepts of quantitative genetics which are introduced in the last third of the course I have not been able to find an appropriate text for this purpose For a quarter of a century Falconer's *Introduction to Quantitative Genetics* has been the standard and excellent text in that subject For my purposes however this text is not sufficiently detailed in the population genetics basis for quantitative theory A number of good texts in population genetics are available of which Li's *First Course in Population Genetics* is didactically the best But these texts are directed toward the genetics of natural populations rather than domestic populations breeding under human control They also tend to treat quantitative genetics gingerly if at all I have therefore developed the present text from my teaching notes The chapters of this book are labeled Lectures Each is intended to correspond approximately to the amount of material which can be covered in a 50 minute lecture Divisions are of course dictated by the natural divisions of the subject matter and the lectures are therefore not of uniform length Nevertheless in so far as possible an attempt has been made to make the average length a lecture's worth *The Science of Human Perfection* Nathaniel Comfort, 2012-09-25 Almost daily we hear news stories advertisements and scientific reports that promise genetic medicine will make us live longer enable doctors to identify and treat diseases before they start and individualize our medical care But surprisingly a century ago eugenicists were making the same promises *The Science of Human Perfection* traces the history of the promises of medical genetics and of the medical dimension of eugenics The book also considers social and ethical issues that cast troublesome shadows over these fields

Keeping his focus on America science historian Nathaniel Comfort introduces the community of scientists physicians and public health workers who have contributed to the development of medical genetics from the nineteenth century to today He argues that medical genetics is closely related to eugenics and indeed the two cannot be fully understood separately He also carefully examines how the desire to relieve suffering and to improve ourselves genetically though noble may be subverted History makes clear that as patients and consumers we must take ownership of genetic medicine using it intelligently knowledgeably and skeptically lest pernicious interests trump our own
