Heterocyclic and tertiary amine N oxides undergo an acid catalysed deoxygenation by sulphoxides at elevated temperatures The reductions are rationalized by postulating the formation of an initial coordination complex formed by attack of the nucleophilic N oxide oxygen atom on the sulphur atom of the sulphoxide or its conjugate base This complex may undergo an internal redox reaction to give a sulphone and amine or alternatively be attacked by a nucleophilic species presumably sulphoxide oxygen to produce a sulphinat and amine Both decomposition pathways were observed Deoxygenation of heterocyclic N oxides however proceeds primarily by the second route and that of aliphatic amine oxides by the first decomposition process These observations are rationalized mechanistically The effect of varying the N oxide substrates and the sulphoxides has also been examined Author *Russian Chemical Reviews*, 1998
