Hemostasis and Thrombosis Protocols David J. Perry, K. John Pasi, 2008-02-02 Laboratory studies in hemostasis have traditionally focused on abnormalities of platelet function or the quantitative and qualitative disorders that affect the proteins involved in blood coagulation However over the last 10 years there has been an explosion in our understanding of the molecular bases that underlie many of the inherited and acquired disorders of hemostasis Many of these disorders are now routinely diagnosed and assessed by methods that involve genotypic analysis Indeed in the late 1990s the distinction between molecular methods for research and for routine diagnosis is becoming increasingly blurred The techniques and approaches that are used in hemostasis are manifold and published in isolation in a variety of publications The aim therefore of this volume Hemostasis and Thrombosis Protocols is to pull together into a single volume the variety of techniques that are frequently used in the field of hemostasis We have targeted this volume at laboratories who wish to move into the field of molecular hemostasis or who may already have some experience in this area but wish to develop new areas of research and diagnosis The chapters are wide ranging and hopefully provide a broad overview of the differing applications in which these standard techniques can be used Though the articles may appear relatively specific the techniques contained within them are applicable to the study of many different disorders and we hope that they provide a series of ideas and concepts well suited to problem solving

Fibrinolysis, 2025-06-18 Fibrinolysis the process of breaking down the fibrin network was reported in 1925 by Fischer who demonstrated that explants of virally induced chicken tumors rapidly caused lysis of plasma clots whereas explants of normal tissue did not This observation provided evidence for the importance of fibrinolysis in cancer Then in 1933 Tillett and Garner observed the liquefaction of a fibrin clot by the plasma of many patients who had recovered from acute hemolytic streptococcal infections These investigators showed that broth cultures of hemolytic streptococci derived from patients could rapidly liquefy normal human fibrin clots This suggested that fibrinolysis might play a key role in homeostasis although its regulation mechanism was unknown Fibrinolysis is now known to be regulated by four components namely the plasminogen activators that function to convert plasminogen into plasmin to initiate fibrin degradation such as tissue type and urokinase type plasminogen activators the plasminogen activator inhibitors that block the plasminogen activators the plasmin inhibitors such as alpha2 antiplasmin and finally the enzymes that block plasminogen binding sites on fibrin or the endothelial cell surface such as the thrombin activatable fibrinolysis inhibitor Originally fibrinolysis was thought to be only responsible for promoting vascular patency the failure of which resulted in myocardial infarction and stroke However recent studies from multiple laboratories have identified the key role of fibrinolysis in a host of physiological and pathophysiological processes Most recently fibrinolysis has been suggested to play a role in forming the premetastatic niche a hospitable site for future metastases in distal tissues which is formed by secretions from the primary tumor before the departure of metastatic cancer cells This book explores the multifaceted and intriguing role of fibrinolysis in several processes including cancer cardiovascular disease neuroinflammation and infection The latest advances in fibrinolytic therapies are also discussed which illustrates the complexity and depth of the field

Treatment-Related Stroke Alexander Tsiskaridze, Arne Lindgren, Adnan I. Qureshi, 2016-12-01 Up to 15% of all strokes occur in hospitalized patients many of whom are there for surgical procedures or cardiac disorders Outcomes can be poor with high mortality possibly related to co morbidities and the complexities of hospital care Risk factors for in hospital stroke include specific operations and procedures such as cardiac surgery previous medical disorders especially a history of stroke or transient ischemic attack and certain physiological characteristics including fever and dehydration More rapid diagnosis and evaluation for interventional therapies is needed This major new book examines the causes of treatment related stroke in most hospital based situations Therapeutic approaches including interventional therapies and intra arterial thrombolysis are highlighted including experimental agents and interventions where other treatment possibilities are limited Increasing the awareness of such interventions is an important factor in reducing delays in the assessment of patients who have strokes while in hospital thus decreasing morbidity and reducing costs
