The Visual System of Fish Ron Douglas, Mustafa Djamgoz,2012-12-06 A question often asked of those of us who work in the seemingly esoteric field of fish vision is why To some of us the answer seems obvious how many other visual scientists get to dive in a tropical lagoon in the name of science and then are able to eat their subjects for dinner However there are better or at least scientifically more acceptable reasons for working on the visual system of fish First in terms of numbers fish are by far the most important of all vertebrate classes probably accounting for over half c 22 000 species of all recognized vertebrate species Nelson 1984 Furthermore many of these are of commercial importance Secondly if one of the research aims is to understand the human visual system animals such as fish can tell us a great deal since in many ways their visual systems and specifically their eyes are similar to our own This is fortunate since there are several techniques such as intracellular retinal recording which are vital to our understanding of the visual process that cannot be performed routinely on primates The cold blooded fish on the other hand is an ideal subject for such studies and much of what we know about for example the fundamentals of information processing in the retina is based on work carried out on fish e g Svaetichin 1953

Pillars of Evolution Douglas W. Morris, Per Lundberg, 2011-07-14 Pillars of Evolution provides a fresh and provocative perspective on adaptive evolution Readers new to the study of evolution will find a refreshing new insight that establishes evolutionary biology as a rigorous and predictive science whilst practicing biologists will discover a provocative book that challenges traditional approaches The book begins by leading readers through the mechanics of heredity reproduction movement survival and development With that framework in place it then explores the numerous ways that traits emerge from the interactions between genetics development and the environment The key message is that adaptive changes in traits and their underlying allelic frequencies evolve through the traits functions and their connection with fitness The complex mappings from genes to traits to fitness are characterized in the structure of evolution A single structure matrix describes why individuals vary in the values of adaptive traits their ability to perform the function of those traits and in the fitness they accrue Fitness depends on how organisms interact with and perceive their environment in time and space These relationships are made explicit in spatial temporal and organizational scale that also sets the stage for the crucially important role that ecology always plays in evolution The ecological hallmarks of density and frequency dependent interactions allow the authors to explore new and exciting insights into evolution's dynamics The theories and principles are then brought together in a final synthesis on adaptation The book's unique approach unites genetic development and environmental influences into a single comprehensive treatment of the eco evolutionary process
