Dermatoglyphics in Medical Disorders B. Schaumann, M. Alter, 2012-12-06 The skin on the fingertips and palmar and plantar surfaces of man is not smooth It is grooved by curious ridges which form a variety of configurations These ridge configurations have attracted the attention of laymen for millenia They have also evoked the serious interest of scientists for more than three centuries The anatomist Bidloo provided a description of ridge detail in the seventeenth century Since then additional information has been added by anthropologists biologists and geneticists For the last century the fact that each individual's ridge configurations are unique has been utilized as a means of personal identification especially by law enforcement officials Widespread medical interest in epidermal ridges developed only in the last several decades when it became apparent that many patients with chromosomal aberrations had unusual ridge formations Inspection of skin ridges therefore promised to provide a simple inexpensive means for determining whether a given patient had a particular chromosomal defect However the promise was only partially fulfilled because of the inherent variability of skin ridge configurations It was possible to draw conclusions about ridge abnormalities in groups of patients but not always in a given individual Patients and clinicians became somewhat disenchanted with the clinical value of studying ridges
