IDEXX Blood Cell Guide

Making a Quality Blood Film

Complement your in-house hematology with a high-quality blood film.

1. Place a small drop of fresh, well-mixed anticoagulated blood on a clean glass slide approximately 1" in from one end of the slide.

2. Place a clean glass "spreader" slide in front of the drop of blood at an approximate 30° angle to the blood-film slide.*

3. Back the "spreader" slide into the drop of blood.

4. Let the blood spread along the contact line between the two slides; this should take place quickly.

5. With a steady fluid movement, move the spreader slide down the entire blood-film slide, maintaining this angle without lifting the spreader slide. Blood from the drop will follow the spreader slide, placing a thin film on the glass slide. The blood film should be 2–4 cm in length.

6. Let the blood film air-dry.†

* Do not use slides with any hemostatic chemicals, including the slide between the slides to make a quick blood film. For optimum, high-quality hemostatic performance, polyethylene (PE) slides are the only slides that slide in these automatic blood filmers.

† Explain that the quality prepared blood film is completely dried before starting a sedimentation centrifuge. If hemolysis is high, only 10–15 sec with a low-speed centrifuge (1000 rpm) will help the erythrocytes settle. Do not overdry.
