The Coupled Theory of Mixtures in Geomechanics with Applications George Z Voyiadjis, C.R. Song, 2006-08-06

Geomaterials consist of a mixture of solid particles and void space that may be filled with liquid and gas. The solid particles may be different in sizes, shapes, and behavior, and the pore liquid may have various physical and chemical properties. Hence, physical, chemical, or electrical interaction between the solid particles and pore liquid or gas may take place. Therefore, the geomaterials in general must be considered a mixture or a multiphase material whose state is described by physical quantities in each phase. The stresses carried by the solid skeleton are typically termed effective stress, while the stresses carried by the pore liquid are termed pore pressure. The summation of the effective stress and pore pressure is termed total stress. Terzaghi (1943) For a free drainage condition or completely undrained condition, the pore pressure change is zero or depends only on the initial stress condition; it does not depend on the skeleton response to external forces. Therefore, a single phase description of soil behavior is adequate. For an intermediate condition, however, some slow pore pressure leak may take place while the force is applied, and the skeleton is under deformation. Due to the leak of pore pressure, the pore pressure changes with time, and the effective stress changes, and the skeleton deforms with time accordingly. The solution of this intermediate condition therefore requires a multi phase continuum formulations that may address the interaction of solid skeleton and pore liquid interaction.
