

Transmission Line Calculations

A lossless transmission line has distributed parameters $L = 1 \text{ mH/m}$ and $C = 5 \text{ pF/m}$ and carries a forward traveling voltage wave with amplitude 10 V at the frequency of 2 MHz . The line is terminated in the load impedance of 72Ω . Calculate (a) characteristic impedance, (b) beta, (c) reflection coefficient at the load, (d) return loss in dB.

To solve this, we'll use the standard transmission line formulas for a lossless line.

Given:

- $L = 1 \text{ mH/m}$
- $C = 5 \text{ pF/m}$
- $V_f = 10 \text{ V}$ (amplitude of forward traveling wave)
- $f = 2 \text{ MHz}$
- $Z_L = 72 \Omega$ (load impedance)

(a) Characteristic Impedance (Z_0)

For a lossless transmission line, the characteristic impedance is given by:

$$Z_0 = \sqrt{\frac{L}{C}}$$

Substituting the values of L and C :

$$Z_0 = \sqrt{\frac{1 \times 10^{-3}}{5 \times 10^{-12}}} = \sqrt{2 \times 10^8} = 1414.21 \Omega$$

(b) Phase constant (β)

The phase constant (β) is related to the wavelength of the signal and can be calculated as:

$$\beta = \omega \sqrt{LC}$$

where:

- $\omega = 2\pi f$ is the angular frequency,
- $f = 2 \text{ MHz} = 2 \times 10^6 \text{ Hz}$.

First, calculate the angular frequency:

Hileman,2018-10-03 This detailed and comprehensive reference presents the latest developments in power system insulation coordination emphasizing the achievement of optimum insulation strength at minimum cost. Comprehensively covering a myriad of insulation coordination techniques the book examines electrical transmission and distribution lines and substations. Supplemented with end of chapter problem sets and over 1700 literature citations, tables, drawings, and equations, the book focuses on the conventional or deterministic method of insulation coordination as well as the probabilistic method with its emphasis on statistical analysis. *Falcon to Gonder 345 KV Transmission Project, Resource Management Plan Amendments ,2001* *Analysis of Multiconductor Transmission Lines* Clayton R. Paul,2007-10-26 The essential textbook for electrical engineering students and professionals now in a valuable new edition. The increasing use of high speed digital technology requires that all electrical engineers have a working knowledge of transmission lines. However, because of the introduction of computer engineering courses into already crowded four year undergraduate programs, the transmission line courses in many electrical engineering programs have been relegated to a senior technical elective, if offered at all. Now *Analysis of Multiconductor Transmission Lines* Second Edition has been significantly updated and reorganized to fill the need for a structured course on transmission lines in a senior undergraduate or graduate level electrical engineering program. In this new edition, each broad analysis topic (e.g., per unit length parameters, frequency domain analysis, time domain analysis, and incident field excitation) now has a chapter concerning two conductor lines, followed immediately by a chapter on MTLs for that topic. This enables instructors to emphasize two conductor lines or MTLs or both. In addition to the reorganization of the material, this Second Edition now contains important advancements in analysis methods that have developed since the previous edition, such as methods for achieving signal integrity (SI) in high speed digital interconnects, the finite difference time domain (FDTD) solution methods, and the time domain to frequency domain transformation (TDFD) method. Furthermore, the content of Chapters 8 and 9 on digital signal propagation and signal integrity application has been considerably expanded upon to reflect all of the vital information current and future designers of high speed digital systems need to know. *Kangley-Echo Lake Transmission Line Project ,2003* **Central Ferry-Lower Monumental 500-kilovolt Transmission Line Project ,2011** **Big Eddy-Knight Transmission Project ,2011** *Flow of Natural Gas Through High-pressure Transmission Lines* United States.
