Arscott, 1995 Heun's equation is a second order differential equation which crops up in a variety of forms in a wide range of problems in applied mathematics These include integral equations of potential theory wave propagation electrostatic oscillation and Schrodinger's equation This volume brings together important research work for the first time providing an important resource for all those interested in this mathematical topic Both the current theory and the main areas of application are surveyed and includes contributions from authoritative researchers such as Felix Arscott Canada P Maroni France and Gerhard Wolf Germany

A Study of Heun's Differential Equation ... John David Neff, 1956 *Selected Papers on Analysis and Differential Equations* American Mathematical Society, 2010 Volume

includes English translation of ten expository articles published in the Japanese journal Sugaku **Second Order Differential Equations** Gerhard Kristensson, 2010-08-05 Second Order Differential Equations presents a classical piece of theory concerning hypergeometric special functions as solutions of second order linear differential equations The theory is presented in an entirely self contained way starting with an introduction of the solution of the second order differential equations and then focusing on the systematic treatment and classification of these solutions Each chapter contains a set of problems which help reinforce the theory Some of the preliminaries are covered in appendices at the end of the book one of which provides an introduction to Poincaré Perron theory and the appendix also contains a new way of analyzing the asymptotic behavior of solutions of differential equations This textbook is appropriate for advanced undergraduate and graduate students in Mathematics Physics and Engineering interested in Ordinary and Partial Differential Equations A solutions manual is available online

Special Functions Sergei I. Ushakov, Wolfgang Lay, 2000 The subject of this book is the theory of special functions not considered as a list of functions exhibiting a certain range of properties but based on the unified study of singularities of second order ordinary differential equations in the complex domain The number and characteristics of the singularities serve as a basis for classification of each individual special function Links between linear special functions as solutions of linear second order equations and non linear special functions as solutions of Painlevé equations are presented as a basic and new result Many applications to different areas of physics are shown and discussed The book is written from a practical point of view and will address all those scientists whose work involves applications of mathematical methods Lecturers graduate students and researchers will find this a valuable text and reference work

functions emerge from boundary eigenvalue problems of Fuchsian differential equations with more than three singularities This detailed reference provides solutions for singular boundary eigenvalue problems of linear ordinary differential equations of second order exploring previously unknown methods for finding higher special functions Starting from the fact that it is the singularities of a differential equation that determine the local as well as the global behaviour of its solutions the author develops methods that are both new and efficient and lead to functional relationships that were previously unknown All the developments discussed are placed within their historical context allowing the reader to trace the roots of the theory back through the work of many generations of great mathematicians Particular attention is given to the work of George Cecil Jaff who laid the foundation with the calculation of the quantum mechanical energy levels of the hydrogen molecule ion
