Heterogeneous Processes Of Geochemical Migration:

Heterogeneous Processes of Geochemical Migration V. S. Golubev, 2012-03-30 The problem of the geochemical migration of elements has received wide attention in the works of V I Vernadskii and A E Fersman 1 2J Vernadskii considered geochemistry to be the science of the history of chemical elements on the earth their distribution and move ments in space and time and their genetic relations IJ Geochemical migration was defined by Fersman as the movement of chemical elements in the earth s crust leading to their dissemination or concentration The views of Vernadskii and Fersman on the migration of elements have received added support and development in connection with successes in physics chemistry biology and other sciences According to Fersman the earth is looked upon as a cosmic body characterized by common origin and Similarity of composition with the sun the planets meteorites and other bodies of the solar system The scale and trend of geochemical migration of elements in the earth are determined by the initial state of terrestrial matter its thermal history and the scale of time The rules of elemental migration are determined by internal and external fac tors Fersman distinguishes five groups of internal factors i e

Landscape Patterns in a Range of Spatio-Temporal Scales Alexander V. Khoroshev, Kirill N. Dyakonov, 2020-03-23 This book presents the polycentric and multiscale view of landscape which has been developed in Russia within a framework of physical geography since the early twentieth century The authors develop the ideas of hierarchical organization of a landscape and strong relationships between abiotic and biotic components with equal attention to both vertical fluxes and lateral transfer Three dimensional representation of landscape involves strong emphasis on abiotic drivers of pattern development including relief geological structures and runoff The objective of this book is to demonstrate the multiplicity of models and multiscale approach to description and explanation of landscape pattern functioning dynamics and evolution The contributions deal with various hierarchical levels ranging from within unit interior variability to between units interaction at landscape level as well as regional and supra regional zonal patterns Divided into 8 clear parts the 28 chapters treat spatial pattern in one of the following aspects indicator of actual matter and energy flows control over actual processes including disturbance expansion as well as determinant of future development indicator of genesis and prerequisite for future trends driver for short term dynamics of processes response to climatic and anthropogenic influences factor of settlement network and land use adaptation at various historical epochs framework for actual land use spatial arrangement This contributed volume is written for researchers and students in the field of landscape ecology physical geography environmental impact assessment and ecological planning

Characterization, Modeling, Monitoring, and Remediation of Fractured Rock National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee on Geological and Geotechnical Engineering, Committee on Subsurface Characterization, Modeling, Monitoring, and Remediation of Fractured Rock, 2021-01-29 Fractured rock is the host or foundation for innumerable engineered structures related to energy water waste and transportation Characterizing modeling and monitoring fractured rock sites is critical to the functioning of those infrastructure as well as to optimizing resource recovery and contaminant management Characterization Modeling Monitoring and Remediation of Fractured Rock examines the state of practice and state of art in the characterization of fractured rock and the chemical and biological processes related to subsurface contaminant fate and transport This report examines new developments knowledge and approaches to engineering at fractured rock sites since the publication of the 1996 National Research Council report Rock Fractures and Fluid Flow Contemporary Understanding and Fluid Flow Fundamental understanding of the physical nature of fractured rock has changed little since 1996 but many new characterization tools have been developed and there is now greater appreciation for the importance of chemical and biological processes that can occur in the fractured rock environment The findings of Characterization Modeling Monitoring and Remediation of Fractured Rock can be applied to all types of engineered

infrastructure but especially to engineered repositories for buried or stored waste and to fractured rock sites that have been contaminated as a result of past disposal or other practices. The recommendations of this report are intended to help the practitioner, researcher, and decision maker take a more interdisciplinary approach to engineering in the fractured rock environment. This report describes how existing tools, some only recently developed, can be used to increase the accuracy and reliability of engineering design and management given the interacting forces of nature. With an interdisciplinary approach, it is possible to conceptualize and model the fractured rock environment with acceptable levels of uncertainty and reliability and to design systems that maximize remediation and long-term performance. Better scientific understanding could inform regulations, policies, and implementation guidelines related to infrastructure development and operations. The recommendations for research and applications to enhance practice of this book make it a valuable resource for students and practitioners in this field.
