*Holomorphy and Calculus in Normed Spaces* S. B. Chae, 1985-04-29 This book presents a systematic introduction to the theory of holomorphic mappings in normed spaces which has been scattered throughout the literature It gives the necessary elementary background for all branches of modern mathematics involving differential calculus in higher dimensional spaces

**Holomorphy and Calculus in Normed Spaces** Soo Bong Chae, 2020-11-26 This book presents a systematic introduction to the theory of holomorphic mappings in normed spaces which has been scattered throughout the literature It gives the necessary elementary background for all branches of modern mathematics involving differential calculus in higher dimensional spaces

**Introduction to Holomorphy** J.A. Barroso, 2000-04-01 This book presents a set of basic properties of holomorphic mappings between complex normed spaces and between complex locally convex spaces These properties have already achieved an almost definitive form and should be known to all those interested in the study of infinite dimensional Holomorphy and its applications The author also makes incursions into the study of the topological properties of the spaces of holomorphic mappings between spaces of infinite dimension An attempt is then made to show some of the several topologies that can naturally be considered in these spaces Infinite dimensional Holomorphy appears as a theory rich in fascinating problems and rich in applications to other branches of Mathematics and Mathematical Physics

*Numerical Range of Holomorphic Mappings and Applications* Mark Elin, Simeon Reich, David Shoikhet, 2019-03-11 This book describes recent developments as well as some classical results regarding holomorphic mappings The book starts with a brief survey of the theory of semigroups of linear operators including the Hille Yosida and the Lumer Phillips theorems The numerical range and the spectrum of closed densely defined linear operators are then discussed in more detail and an overview of ergodic theory is presented The analytic extension of semigroups of linear operators is also discussed The recent study of the numerical range of composition operators on the unit disk is mentioned Then the basic notions and facts in infinite dimensional holomorphy and hyperbolic geometry in Banach and Hilbert spaces are presented L A Harris theory of the numerical range of holomorphic mappings is generalized and the main properties of the so called quasi dissipative mappings and their growth estimates are studied In addition geometric and quantitative analytic aspects of fixed point theory are discussed A special chapter is devoted to applications of the numerical range to diverse geometric and analytic problems

*Foundations of Complex Analysis in Non Locally Convex Spaces* A. Bayoumi, 2003-11-11 All the existing books in Infinite Dimensional Complex Analysis focus on the problems of locally convex spaces However the theory without convexity condition is covered for the first time in this book This shows that we are really working with a new important and interesting field Theory of functions and nonlinear analysis problems are widespread in the mathematical modeling of real world systems

in a very broad range of applications During the past three decades many new results from the author have helped to solve multiextreme problems arising from important situations non convex and non linear cases in function theory Foundations of Complex Analysis in Non Locally Convex Spaces is a comprehensive book that covers the fundamental theorems in Complex and Functional Analysis and presents much new material The book includes generalized new forms of Hahn Banach Theorem Multilinear maps theory of polynomials Fixed Point Theorems p extreme points and applications in Operations Research Krein Milman Theorem Quasi differential Calculus Lagrange Mean Value Theorems Taylor series Quasi holomorphic and Quasi analytic maps Quasi Analytic continuations Fundamental Theorem of Calculus Bolzano s Theorem Mean Value Theorem for Definite Integral Bounding and weakly bounding limited sets Holomorphic Completions and Levi problem Each chapter contains illustrative examples to help the student and researcher to enhance his knowledge of theory of functions The new concept of Quasi differentiability introduced by the author represents the backbone of the theory of Holomorphy for non locally convex spaces In fact it is different but much stronger than the Frechet one The book is intended not only for Post Graduate M Sc The book contains new generalized versions of i Fundamental Theorem of Calculus Lagrange Mean Value Theorem in real and complex cases Hahn Banach Theorems Bolzano Theorem Krein Milman Theorem Mean value Theorem for Definite Integral and many others ii Fixed Point Theorems of Bruower Schauder and Kakutani s bull The book contains some applications in Operations research and non convex analysis as a consequence of the new concept p Extreme points given by the author bull The book contains a complete theory for Taylor Series representations of the different types of holomorphic maps in F spaces without convexity conditions bull The book contains a general new concept of differentiability stronger than the Frechet one This implies a new Differentiable Calculus called Quasi differential or Bayoumi differential Calculus It is due to the author s discovery in 1995 bull The book contains the theory of polynomials and Banach Stienhaus theorem in non convex spaces

**Nucleation in Condensed Matter** K.F. Kelton, Ken Kelton, Alan Lindsay Greer, 2010-05-11

In Nucleation in Condensed Matter key theoretical models for nucleation are developed and experimental data are used to discuss their range of validity A central aim of this book is to enable the reader when faced with a phenomenon in which nucleation appears to play a role to determine whether nucleation is indeed important and to develop a quantitative and predictive description of the nucleation behavior The third section of the book examines nucleation processes in practical situations ranging from solid state precipitation to nucleation in biological systems to nucleation in food and drink Nucleation in Condensed Matter is a key reference for an advanced materials course in phase transformations It is also an essential reference for researchers in the field Unified treatment of key theories experimental evaluations and case studies Complete derivation of key models Detailed discussion of experimental measurements Examples of nucleation in diverse systems

Degenerate Differential Equations in Banach Spaces Angelo Favini, Atsushi Yagi, 1998-09-10 This work presents a detailed study of linear abstract degenerate differential equations using both the semigroups generated by multivalued linear

operators and extensions of the operational method from Da Prato and Grisvard The authors describe the recent and original results on PDEs and algebraic differential equations and establishes the analyzability of the semigroup generated by some degenerate parabolic operators in spaces of continuous functions

**Handbook of Metric Fixed Point Theory** W.A. Kirk, B. Sims, 2013-04-17 Metric fixed point theory encompasses the branch of fixed point theory which metric conditions on the underlying space and or on the mappings play a fundamental role In some sense the theory is a far reaching outgrowth of Banach's contraction mapping principle A natural extension of the study of contractions is the limiting case when the Lipschitz constant is allowed to equal one Such mappings are called nonexpansive Nonexpansive mappings arise in a variety of natural ways for example in the study of holomorphic mappings and hyperconvex metric spaces Because most of the spaces studied in analysis share many algebraic and topological properties as well as metric properties there is no clear line separating metric fixed point theory from the topological or set theoretic branch of the theory Also because of its metric underpinnings metric fixed point theory has provided the motivation for the study of many geometric properties of Banach spaces The contents of this Handbook reflect all of these facts The purpose of the Handbook is to provide a primary resource for anyone interested in fixed point theory with a metric flavor The goal is to provide information for those wishing to find results that might apply to their own work and for those wishing to obtain a deeper understanding of the theory The book should be of interest to a wide range of researchers in mathematical analysis as well as to those whose primary interest is the study of fixed point theory and the underlying spaces The level of exposition is directed to a wide audience including students and established researchers

**Complex Analysis and Dynamical Systems** Mark L'vovich Agranovskii, 2004 This book contains contributions from the participants of an International Conference on Complex Analysis and Dynamical Systems The papers collected here are devoted to various topics in complex analysis and dynamical systems ranging from properties of holomorphic mappings to attractors in hyperbolic spaces Overall these selections provide an overview of activity in analysis at the outset of the twenty first century The book is suitable for graduate students and researchers in complex analysis and related problems of dynamics With this volume the Israel Mathematical Conference Proceedings are now published as a subseries of the AMS Contemporary Mathematics series

**Complex Analysis on Infinite Dimensional Spaces** Sean Dineen, 2012-12-06 Infinite dimensional holomorphy is the study of holomorphic or analytic functions over complex topological vector spaces The terms in this description are easily stated and explained and allow the subject to project itself initially and innocently as a compact theory with well defined boundaries However a comprehensive study would include delving into and interacting with not only the obvious topics of topology several complex variables theory and functional analysis but also differential geometry Jordan algebras Lie groups operator theory logic differential equations and fixed point theory This diversity leads to a dynamic synthesis of ideas and to an appreciation of a remarkable feature of mathematics its unity Unity requires synthesis while synthesis leads to unity It is necessary to stand back every so often to take an overall

look at one s subject and ask How has it developed over the last ten twenty fifty years Where is it going What am I doing I was asking these questions during the spring of 1993 as I prepared a short course to be given at Universidade Federal do Rio de Janeiro during the following July The abundance of suit able material made the selection of topics difficult For some time I hesitated between two very different aspects of infinite dimensional holomorphy the geometric algebraic theory associated with bounded symmetric domains and Jordan triple systems and the topological theory which forms the subject of the present book

**Complex Analysis and Dynamical Systems III** Mark L'vovich Agranovskiĭ,2008 The papers in this volume cover a wide variety of topics in the geometric theory of functions of one and several complex variables including univalent functions conformal and quasiconformal mappings minimal surfaces and dynamics in infinite dimensional spaces In addition there are several articles dealing with various aspects of approximation theory and partial differential equations Taken together the articles collected here provide the reader with a panorama of activity in complex analysis drawn by a number of leading figures in the field
