General Principles of Quantum Field Theory N.N. Bogolubov, Anatoly A. Logunov, A.I. Oksak, I. Todorov, 2012-12-06 The majority of the memorable results of relativistic quantum theory were obtained within the framework of the local quantum field approach The explanation of the basic principles of the local theory and its mathematical structure has left its mark on all modern activity in this area Originally the axiomatic approach arose from attempts to give a mathematical meaning to the quantum field theory of strong interactions of Yukawa type The fields in such a theory are realized by operators in Hilbert space with a positive Poincaré invariant scalar product This classical part of the axiomatic approach

attained its modern form as far back as the sixties It has retained its importance even to this day in spite of the fact that nowadays the main prospects for the description of the electro weak and strong interactions are in connection with the theory of gauge fields In fact from the point of view of the quark model the theory of strong interactions of Wightman type was obtained by restricting attention to just the physical local operators such as hadronic fields consisting of fundamental quark fields acting in a Hilbert space of physical states In principle there are enough such physical fields for a description of hadronic physics although this means that one must reject the traditional local Lagrangian formalism The connection is restored in the approximation of low energy phenomenological Lagrangians Simple Lie Algebras Over Fields of Positive Characteristic Helmut Strade, 2004 Geometry and Analysis on Finite- and Infinite-dimensional Lie Groups Aleksander Strasburger, 2002 Global Analysis and Harmonic Analysis Jean-Pierre Bourguignon, Thomas Branson, Oussama Hijazi, 2000 This book presents the proceedings of a meeting intended to gather researchers working in the fields of harmonic analysis and global analysis to discuss some questions of common interest About twenty talks covered the principal topics illustrating the recent interactions between these two fields The meeting started with a survey on spin geometry and was followed by talks on the spectrum of the Dirac operator in hyperbolic Kählerian and pseudo Riemannian geometry Different aspects of representation theory were discussed Schubert cells unitary representations with reflection symmetry gradient operators and Poisson transformations Another series of talks was devoted to the systematic use of representation theory in global analysis in particular on the Bernstein Gelfand Gelfand sequences in parabolic geometry the construction of conformally covariant operators and some refinements of the Kato inequality in Riemannian geometry Various presentations ranging from general relativity to harmonic maps by way of 4 dimensional geometry topology Seiberg Witten theory and the index theorem in 2 dimensional hyperbolic geometry illustrated the diversity of applications of techniques from harmonic analysis
