It aims to summarize experimental and theoretical discoveries and an understanding of unstable nuclei and their exotic structures which were opened up by the development of radioactive ion RI beam in the late 1980s. The handbook comprises three major parts. In the first part the experiments and measured facts are well organized and reviewed. The second part summarizes recognized theories to explain the experimental facts introduced in the first part. Reflecting recent synergistic progress involving both experiment and theory the chapters both parts are mutually related. The last part focuses on cosmo nuclear physics one of the mainstream subjects in modern nuclear physics. Those comprehensive topics are presented concisely. Supported by introductory reviews all chapters are designed to present their topics in a manner accessible to readers at the graduate level. The book therefore serves as a valuable source for beginners as well helping them to learn modern nuclear physics.

Applied Mechanics Reviews, 1974      **Books in Print Supplement**, 2002      The School Review, 1913      Photonic Band Gap Materials C.M. Soukoulis, 2012-12-06 Photonic band gap crystals offer unique ways to tailor light and the propagation of electromagnetic waves. In analogy to electrons in a crystal EM waves propagating in a structure with a periodically modulated dielectric constant are organized into photonic bands separated by gaps in which propagating states are forbidden. Proposed applications of such photonic band gap crystals operating at frequencies from microwave to optical include zero threshold lasers, low loss resonators and cavities and efficient microwave antennas. Spontaneous emission is suppressed for photons in the photonic band gap offering novel approaches to manipulating the EM field and creating high efficiency light emitting structures. Photonic Band Gap Materials identifies three most promising areas of research. The first is materials fabrication involving the creation of high quality low loss periodic dielectric structures. The smallest photonic crystals yet fabricated have been made by machining Si wafers along 110 and some have lattice constants as small as 500 microns. The second area is in applications. Possible applications presented are microwave mirrors, directional antennas, resonators especially in the 2 GHz region, filters, waveguides, Y splitters and resonant microcavities. The third area covers fundamentally new physical phenomena in condensed matter physics and quantum optics. An excellent review of recent development covering theoretical, experimental and applied aspects. Interesting and stimulating reading for active researchers as well as a useful reference for non specialists.      *ERDA Energy Research Abstracts*, 1983      Energy Research
