Applications Pieter Adriaans, Henning Fernau, Menno van Zaanen, 2002-09-11 The Sixth International Colloquium on Grammatical Inference ICGI2002 was held in Amsterdam on September 23-25th 2002. ICGI2002 was the sixth in a series of successful biennial international conferences on the area of grammatical inference. Previous meetings were held in Essex, UK; Alicante, Spain; Montpellier, France; Ames, Iowa, USA; Lisbon, Portugal. This series of meetings seeks to provide a forum for the presentation and discussion of original research on all aspects of grammatical inference. Grammatical inference, the process of inferring grammars from given data, is a field that not only is challenging from a purely scientific standpoint but also finds many applications in real world problems. Despite the fact that grammatical inference addresses problems in a relatively narrow area, it uses techniques from many domains and is positioned at the intersection of a number of different disciplines. Researchers in grammatical inference come from fields as diverse as machine learning, theoretical computer science, computational linguistics, pattern recognition, and artificial neural networks. From a practical standpoint, applications in areas like natural language acquisition, computational biology, structural pattern recognition, information retrieval, text processing, data compression, and adaptive intelligent agents have either been demonstrated or proposed in the literature. The technical program included the presentation of 23 accepted papers out of 41 submitted. Moreover, for the first time, a software presentation was organized at ICGI. Short descriptions of the corresponding software are included in these proceedings too.

Recognition, Applications K.S. Fu, 2012-12-06 The many different mathematical techniques used to solve pattern

recognition problems may be grouped into two general approaches the decision theoretic or discriminant approach and the syntactic or structural approach In the decision theoretic approach a set of characteristic measurements called features are extracted from the patterns Each pattern is represented by a feature vector and the recognition of each pattern is usually made by partitioning the feature space Applications of decision theoretic approach include character recognition medical diagnosis remote sensing reliability and socio economics A relatively new approach is the syntactic approach In the syntactic approach each pattern is expressed in terms of a composition of its components The recognition of a pattern is usually made by analyzing the pattern structure according to a given set of rules Earlier applications of the syntactic approach include chromosome classification English character recognition and identification of bubble and spark chamber events The purpose of this monograph is to provide a summary of the major recent applications of syntactic pattern recognition After a brief introduction of syntactic pattern recognition in Chapter 1 the nine main chapters Chapters 2-10 can be divided into three parts The first three chapters concern with the analysis of waveforms using syntactic methods Specific application examples include peak detection and interpretation of electro cardiograms and the recognition of speech patterns The next five chapters deal with the syntactic recognition of two dimensional pictorial patterns **Grammatical Inference**, 2000

Grammatical Inference: Algorithms and Applications Alexander Clark, François Coste, Laurent Miclet, 2008-09-11 This book constitutes the refereed proceedings of the 9th International Colloquium on Grammatical Inference ICGI 2008 held in Saint Malo France in September 2008 The 21 revised full papers and 8 revised short papers presented were carefully reviewed and selected from 36 submissions The topics of the papers presented vary from theoretical results of learning algorithms to innovative applications of grammatical inference and from learning several interesting classes of formal grammars to applications to natural language processing Scientific Applications of Language Methods Carlos Martín Vide, 2011 Presenting interdisciplinary research at the forefront of present advances in information technologies and their foundations Scientific Applications of Language Methods is a multi author volume containing pieces of work either original research or surveys exemplifying the application of formal language tools in several fields including logic and discrete mathematics natural language processing artificial intelligence natural computing and bioinformatics *Syntactic And Structural Pattern Recognition - Theory And Applications* Horst Bunke, Alberto Sanfeliu, 1990-01-01 This book is currently the only one on this subject containing both introductory material and advanced recent research results It presents at one end fundamental concepts and notations developed in syntactic and structural pattern recognition and at the other reports on the current state of the art with respect to both methodology and applications In particular it includes artificial intelligence related techniques which are likely to become very important in future pattern recognition The book consists of individual chapters written by different authors The chapters are grouped into broader subject areas like Syntactic Representation and Parsing Structural Representation and Matching Learning etc Each chapter is a self contained presentation of one particular

topic In order to keep the original flavor of each contribution no efforts were undertaken to unify the different chapters with respect to notation Naturally the self containedness of the individual chapters results in some redundancy However we believe that this handicap is compensated by the fact that each contribution can be read individually without prior study of the preceding chapters A unification of the spectrum of material covered by the individual chapters is provided by the subject and author index included at the end of the book Artificial Intelligence and Knowledge Engineering Applications: A Bioinspired Approach José Mira, Jos´ R ILvarez, 2005-06-13 The two volume set LNCS 3561 and LNCS 3562 constitute the refereed proceedings of the First International Work Conference on the Interplay between Natural and Artificial Computation IWINAC 2005 held in Las Palmas Canary Islands Spain in June 2005 The 118 revised papers presented are thematically divided into two volumes the first includes all the contributions mainly related with the methodological conceptual formal and experimental developments in the fields of Neurophysiology and cognitive science The second volume collects the papers related with bioinspired programming strategies and all the contributions related with the computational solutions to engineering problems in different application domains *Grammatical Inference: Theory, Applications and Alternatives, IEE Colloquium on* Institute of Electrical and Electronics Engineers, 1993
