Potassium ions K ions are vital in physiological processes particularly with regard to the cardiovascular system Modulators influence the channels through which these ions flow and the research into modulator drugs of these channels is the subject of rapidly advancing research This work is intended to be of use as a tool for those working in the pharmaceutical industry Early chapters concentrate on the synthesis and structure activity relationships of potassium channel modulators These are followed by discussion on the application of these drugs to different target organs such as the cardiovascular system and the airways The book concludes with a broad overview of clinical experience and future prospects The authors show how potassium channel activators and potassium channel blockers each have a role to play as therapeutic agents for many disorders including asthma and respiratory tract disorders diseases of the central nervous system such as epilepsy and vascular diseases such as angina peripheral vascular disease and high blood pressure This book should therefore also be of interest to those researching into this wide range of diseases

Potassium Channels in Normal and Pathological Conditions J. Vereecke, P. P. van Bogaert, Fons Verdonck, 1995 Sudden arrhythmic death: from basic science to clinical practice Gareth D. Matthews, 2014-10-02

With upwards of 4 5 million deaths worldwide each year and more than one tenth of these occurring in those with no previously documented heart disease sudden arrhythmic death SAD is both a major public health burden and a highly emotive issue for society at large Recent years have witnessed a marked expansion in our knowledge of the physiology underlying SAD both in the context of hereditary and acquired cardiac disorders Thanks largely to work in genetically modified animals the growth in our understanding of mechanisms underlying arrhythmia in the hereditary channelopathies has been particularly marked Our growing knowledge of the fundamental mechanisms underlying SAD has so far failed to spur substantial developments in clinical practice Despite a large body of work in both humans and animals it remains impossible to confidently identify those at high risk of SAD making pre-emptive therapy a challenge What is more with the thankful exception of the implantable cardioverter defibrillators and pharmacological agents in very specific situations there has been depressingly little progress in finding new and effective therapies This Research Topic aims to go some way towards bridging the gap between advances in basic science and the development and delivery of new therapies It brings together original research contributions and review articles from key opinion leaders in the field focusing on the direct clinical implications of the basic science research now and in the future
