*Microbial Fermentation for Improved Sensory Properties and Functionality of Sustainable Foods* Sylvester Holt,Michela Verni,Carlo Giuseppe Rizzello,2024-03-11 Traditional foods such as red meat and beer have unique recognizable and desirable sensory traits However public awareness about health and the climate crisis is now driving consumers and governmental organizations to consume less meat and alcohol These recognizable flavors are either missing in novel foods because the material is different plant based or removed after the fermentation process Therefore there is a need for

innovation of the flavor texture and trigeminal sensations to meet the expectations for the expanding consumer groups. Improvements with proteins and microbial fermentation processes are currently in the process of making novel foods a global commercial success. For example, recent progress in plant-based foods has focused on the production of proteins that may lead to umami flavors and precursors that are transformed into savory flavor compounds in the cooking process. New non-conventional yeast species provide a very promising route to bioflavoring of foods and beverages. In addition, the nutritious value of foods can be dramatically improved by introducing new pathways that produce vitamins and micronutrients for example for vulnerable groups such as elderly people with a limited diversity of food choice. The functionality of the food may also be increased by the release/synthesis of bioactive compounds with functional potential: antimicrobial, antioxidant, immunomodulatory activities etc.

It opens with a taxonomy of fungi in foods and feeds and then considers ecology, spoilage and mycotoxin production by fungi in foods and feeds. This is followed by a series
