Gocksch,R D Pisarski,1992-03-31 The articles in this book review recent developments in the microscopic theory of optical and electronic semiconductor properties Many advances in this active field are intimately related to the work of Hartmut Haug and his coworkers At the occasion of Haug s 60th birthday a number of current and or former members of his research team review the current state of the art Topics include the quantum kinetics of electrons phonons and photons coherent optical effects quantum transport ballistic motion microscopic semiconductor laser theory with special emphasis on microlasers symmetry aspects of laser excited semiconductors as well as a review of the two dimensional Wigner crystal in a strong magnetic field The articles present the material in sufficient detail to be understandable by advanced graduate students and researchers who have a good background in quantum mechanics What Next? Understanding the behavior of matter at ultra high density such as neutron stars require the knowledge of ground state properties of Quantum chromodynamics QCD at finite chemical potential However this task has turned out to be very difficult because of two main reasons 1 QCD may still be strongly coupled at those regimes making perturbative calculations unreliable and 2 QCD at finite density suffers from the sign problem that makes the use of lattice simulation problematic and it even affects phenomenological models In the first part of this thesis we show that the sign problem in analytical calculations of finite density models can be solved by considering the CK symmetric where C is charge conjugation and K is complex conjugation complex saddle points of the effective action We then explore the properties and consequences of such complex saddle points at non zero temperature and density Due to CK symmetry the mass matrix eigenvalues in these models are not always real

but can be complex which results in damped oscillation of the density density correlation function a new feature of finite density models To address the generality of such behavior we next consider a lattice model of QCD with static quarks at strong coupling Computation of the mass spectrum confirms the existence of complex eigenvalues in much of temperature chemical potential plane This provides an independent confirmation of our results obtained using phenomenological models of QCD The existence of regions in parameter space where density density correlation function exhibit damped oscillation is one of the hallmarks of typical liquid gas system The formalism developed to tackle the sign problem in QCD models actually gives a simple understanding for the existence of such behavior in liquid gas system To this end we develop a generic field theoretic model for the treatment of liquid gas phase transition An effective field theory at finite density derived from a fundamental four dimensional field theory turns out to be complex but CK symmetric The existence of CK symmetry results in complex mass eigenvalues which in turn leads to damped oscillatory behavior of the density density correlation function In the last part of this thesis we study the effect of large amplitude density oscillations on the transport properties of superfluid nuclear matter In nuclear matter at neutron star densities and temperature Cooper pairing leads to the formations of a gap in the nucleon excitation spectra resulting in exponentially strong Boltzmann suppression of many transport coefficients Previous calculations have shown evidence that density oscillations of sufficiently large amplitude can overcome this suppression for flavor changing beta processes via the mechanism of gap bridging We address the simplifications made in that initial work and show that gap bridging can counteract Boltzmann suppression of neutrino emissivity for the realistic case of modified Urca processes in matter with 3P2 neutron pairing

Effective Theories for QCD at Nonzero

Zhang,2012 **QCD Bound States and Their Response to Extremes of Temperature and Density**,2001 We describe the application of Dyson Schwinger equations to the calculation of hadron observable The studies at zero temperature T and quark chemical potential μ provide a springboard for the extension to finite T μ Our exemplars highlight that much of hadronic physics can be understood as simply a manifestation of the nonperturbative momentum dependent dressing of the elementary Schwinger functions in QCD *Lattice QCD at Finite Temperature and Density*,2004 With the operation of the RHIC heavy ion program the theoretical understanding of QCD at finite temperature and density has become increasingly important Though QCD at finite temperature has been extensively studied using lattice Monte Carlo simulations over the past twenty years most physical questions relevant for RHIC and future heavy ion experiments remain open In lattice QCD at finite temperature and density there have been at least two major advances in recent years First for the first time calculations of real time quantities like meson spectral functions have become available Second the lattice study of the QCD phase diagram and equation of state have been extended to finite baryon density by several groups Both issues were extensively discussed in the course of the workshop A real highlight was the study of the QCD phase diagram in T μ plane

by Z Fodor and S Katz and the determination of the critical end point for the physical value of the pion mass. This was the first time such lattice calculations at the physical pion mass have been performed. Results by Z Fodor and S Katz were obtained using a multi parameter re weighting method. Other determinations of the critical end point were also presented in particular using a Taylor expansion around $\mu = 0$ Bielefeld group Ejiri et al and using analytic continuation from imaginary chemical potential Ph de Forcrand and O Philipsen. The result based on Taylor expansion agrees within errors with the new prediction of Z Fodor and S Katz while methods based on analytic continuation still predict a higher value for the critical baryon density. Most of the thermodynamics studies in full QCD including those presented at this workshop have been performed using quite coarse lattices $a = 0.2 - 0.3$ fm. Therefore one may worry about cutoff effects in different thermodynamic quantities like the transition temperature $T_{\text{sub tr}}$. At the workshop U Heller presented a study of the transition temperature for three different lattice spacings and performed a continuum extrapolation of $T_{\text{sub tr}}$ for the first time. Lattice calculations of the meson spectral functions were presented by M Asakawa, S Datta, E Laermann and H Matsufuru. These show that charmonia ground states η_c and J/ψ continue to exist in the plasma at least up to a temperature of $1.7 T_{\text{sub tr}}$. At what temperature charmonia states cease to exist is not yet clear. Calculations presented by M Asakawa show dissolution of the J/ψ at $T = 1.7 T_{\text{sub tr}}$ while the analysis presented by H Matsufuru provided evidence that ground state charmonia still exist at this temperature. S Datta argued that the ground state charmonia is likely to dissolve only for temperatures $T > 2.25 T_{\text{sub tr}}$ while the P states are dissociated at $1.1 T_{\text{sub tr}}$. It is also very interesting that even in the case of light quarks meson spectral functions show a resonance like structure in the plasma phase talk by E Laermann. Finally attempts to calculate transport properties in the Quark Gluon Plasma were presented by S Gupta. The workshop devoted special attention to the finite temperature modification of inter quark forces and color screening another area where considerable progress has been made in recent years talks by O Kaczmarek, K Petrov, O Philipsen and F Zantow. Many other new theoretical developments which cannot be discussed here were also presented on the workshop. Altogether the workshop was a great success for which we thank all the participants.
