Kossowsky, Nir Kossovsky, 2012-12-06 Advances in Materials Science and Implant Orthopedic Surgery brings together experts from major university hospitals materials scientists specializing in bio materials and development engineers working for implant manufacturers to address such issues as mechanisms of fixation foreign body immune response generation and consequences of ionic and wear debris materials selection design and manufacturing schemes and surgical techniques to maximize the safety and efficacy of the devices Aseptic Loosening of Orthopedic Implants Mehdi Amirhosseini, 2019-05-24 Aseptic loosening is the main cause of failure of orthopedic prostheses With no pharmaceuticals to prevent or mitigate periprosthetic bone degradation a surgery to replace the loose implant with a new one is the only choice to restore patients function Most studies on mechanisms for aseptic loosening investigate wear debris particle induced osteolysis However pathological loading conditions around unstable implants can also trigger osteoclast differentiation and bone loss In the first study global gene expression changes induced by mechanical instability of implants and by titanium particles were compared in a validated rat model for aseptic loosening Microarray analysis showed that similar signaling pathways and gene expression patterns are involved in particle and instability induced periprosthetic osteolysis with an early onset innate immune response as a hallmark of osteolysis induced by mechanical instability Further effects of potential therapeutics on restriction of excessive osteoclast differentiation were evaluated Wnt signaling pathway is known to regulate bone remodeling In the second study effects of inactivation of glycogen synthase kinase 3 beta GSK 3 a negative regulator of canonical Wnt signaling on instability induced periprosthetic osteolysis were examined using our rat model for aseptic loosening Inhibition of GSK 3 led to a decrease in osteoclast numbers in the periprosthetic bone tissue exposed to mechanical instability while osteoblast perimeter showed an increase This was accompanied by higher bone volume fraction BV TV in animals treated with the GSK 3 inhibitor In the third study potential beneficial effects of two selective inhibitors of cyclindependent kinase 8 19 CDK8 19 on bone tissue were evaluated CDK8 19 is a Mediator complex associated transcriptional regulator involved in several signaling pathways CDK8 19 inhibitors mainly under investigation as treatments for tumors are reported to enhance osteoblast differentiation and bone formation We show in this study for the first time that inhibition of CDK8 19 led to marked suppression of osteoclast differentiation from bone marrow macrophages in vitro through disruption of the RANK signaling In mouse primary osteoblasts downregulation of osteopontin mRNA a negative

regulator of mineralization together with increased alkaline phosphatase activity and calcium deposition indicated that osteoblast mineralization was promoted by CDK8 19 inhibition Moreover local administration of a CDK8 19 inhibitor promoted cancellous bone regeneration in a rat model for bone healing These studies contribute to better understanding of mechanisms behind mechanical instability induced periprosthetic osteolysis and propose potential therapeutics to restrict bone loss with effects on both osteoclasts and osteoblasts Literature Search National Library of Medicine (U.S.),1979
