

process. She explained that this phase of the process is where the three groups differ most in their approach. At FDA, the criteria and conditions related to the food products that might bear a claim must be considered as well as the legal and economic factors on the use of claims in labeling. The DGAC considers not only the evidence from SRs for its conclusions but also data analysis from the National Health and Nutrition Examination Survey to understand current intakes, as well as food pattern modeling to structure healthful dietary patterns. Schneeman explained that the DGAC integrates the evidence from these approaches to develop its conclusions. At WHO, SRs and MAs are integrated into decision making using a series of contextual factors to determine the strength of the recommendations. For example, WHO considers the balance of benefits and harms, resource implications, confidence in effect estimates, equity and human rights, and accessibility and feasibility.

Schneeman shared some observations from her experiences using MAs in the decision-making process. She stated that a well-designed SR is essential for a proper MA. She recommended involving methodology experts in designing the SR and performing the MA. She also recommended conducting a scoping review before an SR to set the SR's parameters and focus on information critical to the decision making. Schneeman said that SRs should be designed to fit the purpose of the policy or guidance, and MAs should allow for a deeper examination of the evidence to better understand its strength. However, Schneeman said, when MAs are not possible, other tools such as harvest plots can be used.

Schneeman provided a brief overview of the opportunities and challenges for using MAs to develop guidance across the three bodies. She suggested that, at FDA, a graphic display (e.g., a forest plot) might better illustrate the balance of evidence and serve as a useful tool to clarify inconsistencies in the current evidence. For the DGAC, MAs could provide more transparency when rating the strength of the evidence. She also suggested that non-qualitative summary tools could facilitate recommendations related to the food environment and

policy and that subgroup analyses could better help the committee understand what subgroups would benefit most from specific changes to the DGA. Schneeman noted that MAs are used for guideline development at WHO, which allows experts in methodology to assess the strength of the evidence and for expert guidance committees to use the MAs in the development of the recommendations. She pointed out that MAs could also be used to determine when evidence is insufficient to produce a recommendation.

#### **PANEL DISCUSSION**

Nishida led a panel discussion featuring Benkhedda and Schneeman, who were joined by Malik and Akl.

#### **Tools to Assess the Quality of Evidence from Nutrition Research to Inform Policy**

Planning committee member Russell de Souza, echoed by other audience members, asked whether the field of nutrition is so unique that it requires its own set of statistical and analytical tools. Akl replied, disclosing that his role as part of the GRADE working group has informed his perspective, and stated that while many fields may consider theirs to be unique, his opinion is that the principles should be the same across fields. The general principles across fields are that certainty in effect estimates is affected by risk of bias, inconsistency of results, imprecision, indirect evidence, and publication bias. However, Akl said, in certain fields, due to population size, small effect sizes may be more meaningful. What is judged as a small effect size in one field might be significant in another field.

Akl described some factors that he thinks are particularly relevant to the nutrition field. For example, in nutrition, it is common to have outcomes with continuous measurements. Continuous scales often show heterogeneity due to the nature of the data. This factor should be considered when assessing heterogeneity in nutrition research, Akl said, but not "over-rated," which could lead to the downgrading of the certainty of evidence. He noted that FDA and DGAC use different approaches for different goals: validation of health claims and development of guidelines, respectively. Akl
