MILLER, 2013-12-21 **Creative People at Work** Doris B. Wallace, Howard E. Gruber, 1992-06-25 To demystify creative work without reducing it to simplistic formulas Doris Wallace and Howard Gruber one of the world's foremost authorities on creativity have produced a unique book exploring the creative process in the arts and sciences The book's original evolving systems approach treats creativity as purposeful work and integrates cognitive emotional aesthetic and motivational aspects of the creative process Twelve revealing case studies explore the work of such diverse people as William Wordsworth Albert Einstein Jean Piaget Anais Nin and Charles Darwin The case study approach is discussed in relation to other methods such as biography autobiography and psychobiology Emphasis is given to the uniqueness of each creative person the social nature of creative work is also treated without losing the sense of the individual A final chapter considers the relationship between creativity and morality in the nuclear age In addition to developmental psychologists and cognitive scientists this study offers fascinating insights for all readers interested in the history of ideas scientific discovery artistic innovation and the interplay of intuition inspiration and purposeful work Scientific and Technological Thinking Michael E. Gorman, Ryan D.

Tweney, David C. Gooding, Alexandra P. Kincannon, 2004-09-22 At the turn of the 21st century the most valuable commodity in society is knowledge particularly new knowledge that may give a culture company or laboratory an adaptive advantage Knowledge about the cognitive processes that lead to discovery and invention can enhance the probability of making valuable new discoveries and inventions Such knowledge needs to be made widely available to ensure that no particular interest group corners the market on techno scientific creativity Knowledge can also facilitate the development of business strategies and social policies based on a genuine understanding of the creative process Furthermore through an understanding of principles underlying the cognitive processes related to discovery educators can utilize these principles to teach students effective problem solving strategies as part of their education as future scientists This book takes the reader out onto the cutting edge of research in scientific and technological thinking The editors advocate a multiple method approach chapters include detailed case studies of contemporary and historical practices experiments computational simulations and innovative theoretical analyses The editors attempt a provocative synthesis of this work at the end In order to achieve true scientific and technological progress an understanding of the process by which species are transforming the world is needed This book makes an important step in that direction by leading to breakthroughs in the understanding of discovery and invention

Thought Experiments in Science, Philosophy, and the Arts Melanie Frappier, Letitia Meynell, James Robert Brown, 2012-09-10 From Lucretius throwing a spear beyond the boundary of the universe to Einstein racing against a beam

of light thought experiments stand as a fascinating challenge to the necessity of data in the empirical sciences Are these experiments conducted uniquely in our imagination simply rhetorical devices or communication tools or are they an essential part of scientific practice This volume surveys the current state of the debate and explores new avenues of research into the epistemology of thought experiments **Thought Experiments in Philosophy, Science, and the Arts** Mélanie Frappier, Letitia Meynell, James Robert Brown, 2013 From Lucretius throwing a spear beyond the boundary of the universe to Einstein racing against a beam of light thought experiments stand as a fascinating challenge to the necessity of data in the empirical sciences Are these experiments conducted uniquely in our imagination simply rhetorical devices or communication tools or are they an essential part of scientific practice This volume surveys the current state of the debate and explores new avenues of research into the epistemology of thought experiments **Image and Reality** Alan J. Rocke, 2010-05-15 Nineteenth century chemists were faced with a particular problem how to depict the atoms and molecules that are beyond the direct reach of our bodily senses In visualizing this microworld these scientists were the first to move beyond high level philosophical speculations regarding the unseen In *Image and Reality* Alan Rocke focuses on the community of organic chemists in Germany to provide the basis for a fuller understanding of the nature of scientific creativity Arguing that visual mental images regularly assisted many of these scientists in thinking through old problems and new possibilities Rocke uses a variety of sources including private correspondence diagrams and illustrations scientific papers and public statements to investigate their ability to not only imagine the invisibly tiny atoms and molecules upon which they operated daily but to build detailed and empirically based pictures of how all of the atoms in complicated molecules were interconnected These portrayals of chemical structures both as mental images and as paper tools gradually became an accepted part of science during these years and are now regarded as one of the central defining features of chemistry In telling this fascinating story in a manner accessible to the lay reader Rocke also suggests that imagistic thinking is often at the heart of creative thinking in all fields *Image and Reality* is the first book in the Synthesis series a series in the history of chemistry broadly construed edited by Angela N H Creager John E Lesch Stuart W Leslie Lawrence M Principe Alan Rocke E C Spary and Audra J Wolfe in partnership with the Chemical Heritage Foundation **Flight from Wonder** Albert Rothenberg, 2015 Scientific breakthroughs have had far reaching social and physical effects on modern civilization yet until recently there have been relatively few investigations into the nature of scientific creativity itself *Flight from Wonder* reports the findings from an empirical study of 42 Nobel laureates in science from the United States and Europe concerning the creative processes that yield scientific innovation To this end Albert Rothenberg designed an interview scheme to delineate the content and sequences of processes that lead scientists to specific creative achievements He conducted interviews with Nobel laureates in the fields of medicine physiology physics and chemistry while carrying out matching interviews with a control group consisting of twelve accomplished engineers on the faculty of a leading engineering university Rothenberg's results

demonstrate that the Nobel laureates perform three distinct cognitive creative processes to achieve key formulations and discoveries the detailed nature and structure of these findings were reviewed and corroborated by each of the Nobel laureates To supplement his findings Rothenberg engages with autobiographical accounts and work in progress manuscripts pertaining to the creative discoveries of outstanding scientists of the past including Albert Einstein Charles Darwin Max Planck Neils Bohr Hideki Yukawa and James Watson The book will interest students and general science readers fascinated by the development of scientific inquiry and innovation

The Absent Image Elina

Gertsman, 2021-06-22 Winner of the 2022 Charles Rufus Morey Award from the College Art Association Winner of the 2023 Otto Gröndler Book Prize from Western Michigan University Guided by Aristotelian theories medieval philosophers believed that nature abhors a vacuum Medieval art according to modern scholars abhors the same The notion of horror vacui the fear of empty space is thus often construed as a definitive feature of Gothic material culture In *The Absent Image* Elina Gertsman argues that Gothic art in its attempts to grapple with the unrepresentability of the invisible actively engages emptiness voids gaps holes and erasures Exploring complex conversations among medieval philosophy physics mathematics piety and image

making Gertsman considers the concept of nothingness in concert with the imaginary revealing profoundly inventive approaches to emptiness in late medieval visual culture from ingenious images of the world's creation ex nihilo to figurations of absence as a replacement for the invisible forces of conception and death Innovative and challenging this book will find its primary audience with students and scholars of art religion physics philosophy and mathematics It will be particularly welcomed by those interested in phenomenological and cross disciplinary approaches to the visual culture of the later Middle Ages

Mind, Meaning and Scientific Explanation John-Michael Kuczynski, A comprehensive treatise on analytic philosophy with special attention paid to the theoretical basis of psychopathology

The Revealing Image Joy Schaverien, 2021-11-18 Schaverien painstakingly describes and defines processes which have so far only been intuitively known to art therapists p6 by introducing and elaborating the psychoanalytical concepts of transference and countertransference in relation to the use of visual art objects The authors stated intention in this book is to attempt to bridge the perceived gap between the practice of art therapy and analytical forms of psychotherapy p 229 The epistemological base of this venture includes the fields of philosophy anthropology and aesthetics as well as psychoanalysis Schaverien suggests that analytical art psychotherapy is a way of working analytically with patients who are unsuitable or unready for psychotherapy giving examples of psychotic and borderline patients children and patients in psychiatric settings This is primarily a book about an analytical approach within art therapy which may be of interest in itself The material also raises issues of interest to analysts and psychotherapists whether or not they work with art in the clinical setting The book clarifies areas of similarity between the disciplines and also makes areas of difference apparent For example most analysts would agree that visual art like dream material and other non verbal representations of the inner world can at times articulate and communicate meanings which for one reason or another cannot be verbally articulated at the time and that this can be pertinent to the aim of analysis However I think few analysts would include facilities in their consulting rooms for the kind of art processes described in the book When the analyst is working with materials in this form the book will be extremely helpful in sorting out the complexity of the transference situation and the role of interpretation The book is so strongly grounded in experiences emerging in the presence of actual art processes and objects that I think it will be of most interest to those who are interested in the specific clinical issues involved in relating to the making and use of actual art objects within the setting Schaverien not only describes the processes involved in detail but also presents technical approaches to the making and handling of art objects within the setting which will inform the capacity of those who are not trained as art therapists to relate to this kind of material in the consulting room

Thematic Origins of Scientific Thought Gerald Holton, 1988-05-25 The highly acclaimed first edition of this major work convincingly established Gerald Holton's analysis of the ways scientific ideas evolve His concept of themata induced from case studies with special attention to the work of Einstein has become one of the chief tools for understanding scientific progress It is now one of the main

approaches in the study of the initiation and acceptance of individual scientific insights Three principal consequences of this perspective extend beyond the study of the history of science itself It provides philosophers of science with the kind of raw material on which some of the best work in their field is based It helps intellectual historians to redefine the place of modern science in contemporary culture by identifying influences on the scientific imagination And it prompts educators to reexamine the conventional concepts of education in science In this new edition Holton has masterfully reshaped the contents and widened the coverage Significant new material has been added including a penetrating account of the advent of quantum physics in the United States and a broad consideration of the integrity of science as exemplified in the work of Niels Bohr In addition a revised introduction and a new postscript provide an updated perspective on the role of themata The result of this thoroughgoing revision is an indispensable volume for scholars and students of scientific thought and intellectual history

Victorian Science and Imagery Nancy Rose Marshall, 2021-07-27 The nineteenth century was a period of science and imagery when scientific theories and discoveries challenged longstanding boundaries between animal plant and human and when art and visual culture produced new notions about the place of the human in the natural world Just as scientists relied on graphic representation to conceptualize their ideas artists moved seamlessly between scientific debate and creative expression to support or contradict popular scientific theories such as Darwin's theory of evolution and sexual selection deliberately drawing on concepts in ways that allowed them to refute popular claims or disrupt conventional knowledges Focusing on the close kinship between the arts and sciences during the Victorian period the art historians contributing to this volume reveal the unique ways in which nineteenth century British and American visual culture participated in making science and in which science informed art at a crucial moment in the history of the development of the modern world Together they explore topics in geology meteorology medicine anatomy evolution and zoology as well as a

range of media from photography to oil painting They remind us that science and art are not tightly compartmentalized separate influences Rather these are fields that share forms manifest as waves layers lines or geometries that invest in the idea of the evolution of form and that generate surprisingly kindred responses such as pain pleasure empathy and sympathy
