Wild Harvest Karen Hardy, Lucy Kubiak Martens, 2016-04-20 Plants are fundamental to life they are used by all human groups and most animals They provide raw materials vitamins and essential nutrients and we could not survive without them Yet access to plant use before the Neolithic can be challenging In some places plant remains rarely survive and reconstructing plant use in pre agrarian contexts needs to be conducted using a range of different techniques This lack of visible evidence has led to plants being undervalued both in terms of their contribution to diet and as raw materials This book outlines why the role of

plants is required for a better understanding of hominin and pre agrarian human life and it offers a variety of ways in which this can be achieved Wild Harvest is divided into three sections In section 1 each chapter focuses on a specific feature of plant use by humans this covers the role of carbohydrates the need for and effects of processing methods the role of plants in self medication among apes plants as raw materials and the extent of evidence for plant use prior to the development of agriculture in the Near East Section 2 comprises seven chapters which cover different methods available to obtain information on plants and the third section has five chapters each covering a topic related to ethnography ethnohistory or ethnoarchaeology and how these can be used to improve our understanding of the role of plants in the pre agrarian past

Invasion Biology and Ecological Theory Herbert H. T. Prins, Iain J. Gordon, 2014-01-23 Many conservationists argue that invasive species form one of the most important threats to ecosystems the world over often spreading quickly through their new environments and jeopardising the conservation of native species As such it is important that reliable predictions can be made regarding the effects of new species on particular habitats This book provides a critical appraisal of ecosystem theory using case studies of biological invasions in Australasia Each chapter is built around a set of eleven central hypotheses from community ecology which were mainly developed in North American or European contexts The authors examine the hypotheses in the light of evidence from their particular species testing their power in explaining the success or failure of invasion and accepting or rejecting each hypothesis as appropriate The conclusions have far reaching consequences for the utility of community ecology suggesting a rejection of its predictive powers and a positive reappraisal of natural history
