Mathematical Constants II Steven R. Finch,2003 Famous mathematical constants include the ratio of circular circumference to diameter π and the natural logarithm base e . Students and professionals can often name a few others but there are many more buried in the literature and awaiting discovery. How do such constants arise and why are they important? Here the author renews the search he began in his book *Mathematical Constants* adding another 133 essays that broaden the landscape. Topics include the minimality of soap film surfaces, prime numbers, elliptic curves and modular forms, Poisson-Voronoi tessellations, random triangles, Brownian motion, uncertainty inequalities, Prandtl-Blausius flow from fluid dynamics, Lyapunov exponents, knots and tangles, continued fractions, Galton-Watson trees, electrical capacitance from potential theory, Zermelo's navigation problem and the optimal control of a pendulum. Unsolved problems appear virtually everywhere as well. This volume continues an outstanding scholarly attempt to bring together all significant mathematical constants in one place. *Analytic Functions* Blazejewko 1982 J. Lawrynowicz,2006-11-14 **Conformal and Potential Analysis in Hele-Shaw Cells** Björn Gustafsson,Alexander Vasil'ev,2006-08-13 This monograph presents recent and new ideas arising from the study of problems of planar fluid dynamics and which are interesting from the point of view of geometric function theory and potential theory; the book is concerned with geometric problems for Hele-Shaw flows. Additionally, Hele-Shaw flows on parameter spaces are discussed and connections with string theory are revealed. Assumes a graduate level understanding of real and complex analysis and fluid mechanics. *Moduli of Families of Curves for Conformal and Quasiconformal Mappings* Alexander Vasil'ev,2004-10-19 The monograph is concerned with the modulus of families of curves on Riemann surfaces and its applications to extremal problems for conformal quasiconformal mappings and the extension of the modulus onto Teichmüller spaces. The main part of the monograph deals with extremal problems for compact classes of univalent conformal and quasiconformal mappings. Many of them are grouped around two-point distortion theorems. Montel's functions and functions with fixed angular derivatives are also considered. The last portion of problems is directed to the extension of the modulus, varying the complex structure of the underlying Riemann surface that sheds some new light on the metric problems of Teichmüller spaces. *Complex Analysis and Dynamical Systems* Mark Agranovsky,Anatoly Golberg,Fiana Jacobzon,David Shoikhet,Lawrence Zalcman,2018-01-31 This book focuses on

developments in complex dynamical systems and geometric function theory over the past decade showing strong links with other areas of mathematics and the natural sciences Traditional methods and approaches surface in physics and in the life and engineering sciences with increasing frequency the Schramm Loewner evolution Laplacian growth and quadratic differentials are just a few typical examples This book provides a representative overview of these processes and collects open problems in the various areas while at the same time showing where and how each particular topic evolves This volume is dedicated to the memory of Alexander Vasiliev

Handbook of Complex Analysis Reiner Kuhnau, 2002-12-05 Geometric Function Theory is a central part of Complex Analysis one complex variable The Handbook of Complex Analysis Geometric Function Theory deals with this field and its many ramifications and relations to other areas of mathematics and physics The theory of conformal and quasiconformal mappings plays a central role in this Handbook for example a priori estimates for these mappings which arise from solving extremal problems and constructive methods are considered As a new field the theory of circle packings which goes back to P Koebe is included The Handbook should be useful for experts as well as for mathematicians working in other areas as well as for physicists and engineers A collection of independent survey articles in the field of Geometric Function Theory Existence theorems and qualitative properties of conformal and quasiconformal mappings A bibliography including many hints to applications in electrostatics heat conduction potential flows in the plane

Classical and Stochastic Laplacian Growth Björn Gustafsson, Razvan Teodorescu, Alexander Vasil'ev, 2014-11-14 This monograph covers a multitude of concepts results and research topics originating from a classical moving boundary problem in two dimensions idealized Hele Shaw flows or classical Laplacian growth which has strong connections to many exciting modern developments in mathematics and theoretical physics Of particular interest are the relations between Laplacian growth and the infinite size limit of ensembles of random matrices with complex eigenvalues integrable hierarchies of differential equations and their spectral curves classical and stochastic Loewner evolution and critical phenomena in two dimensional statistical models weak solutions of hyperbolic partial differential equations of singular perturbation type and resolution of singularities for compact Riemann surfaces with anti holomorphic involution The book also provides an abundance of exact classical solutions many explicit examples of dynamics by conformal mapping as well as a solid foundation of potential theory An extensive bibliography covering over twelve decades of results and an introduction rich in historical and biographical details complement the eight main chapters of this monograph Given its systematic and consistent notation and background results this book provides a self contained resource It is accessible to a wide readership from beginner graduate students to researchers from various fields in natural sciences and mathematics
