Unfolded Proteins Trevor P. Creamer, 2008 The word revolution has a number of definitions The American Heritage Dictionary 2006 The one most pertinent to this series and volume is a sudden or momentous change in a situation Recent years have seen an unprecedented explosion of interest in unfolded proteins in all of their various forms Coupled with this increase in interest we have seen momentous changes in the way unfolded proteins are viewed Two particular paradigms have come under close scrutiny unfolded proteins are disordered random coils devoid of persistent structure and protein function first requires protein structure The first of these is currently a hotly debated subject The second paradigm we can safely claim has been overturned There is a second definition of revolution that is quite relevant to a significant portion of the work reviewed herein in particular those chapters dealing with local and persistent structure in unfolded proteins That definition is a turning or rotational motion about an axis The American Heritage Dictionary 2006 About four decades ago Charles Tanford 1968 demonstrated that highly denatured proteins possess hydrodynamic properties consistent with Paul Flory's random coil Flory 1969 Given that the Flory random coil definition included the stipulation that conformers making up the denatured state ensemble would differ in energy by just a few kT there has been the assumption that denatured states must therefore be completely random in nature with no persistent structure or biases towards particular conformers Notably however Tanford did note the random coil like hydrodynamic data he obtained did not necessarily rule out the presence of structure in denatured proteins Tanford 1968 Around the same time Sam Krimm and M Lois Tiffany noted that the CD spectra they obtained for proteins in the presence of high concentration of chemical denaturants had similarities to spectra obtained for homopolymers of proline lysine and glutamic acid in water Tiffany and Krimm 1968a 1968b 1973 1974 Homopolymers of these residues were known to adopt the left handed polyproline II conformation leading Tiffany and Krimm to hypothesise that highly denatured proteins possess significant polyproline II helix content Of these two views that espousing the lack of structure in denatured proteins became more widely adopted and was over time adopted as a central paradigm in protein folding As several of the chapters in this volume note a Tiffany and Krimm like view appears to be to some extent the more correct one The level to which it is correct is still unknown although it is clear that the polyproline II helical conformation is not the only perhaps not even the most common persistent conformation present in unfolded proteins Thus we have come through a full circle or revolution from the preface Economic Report of the President United States. Male Suicide and Masculinity in 19th-century Britain

Lyndsay Galpin, 2022-04-07 This book shows how interpretations of suicidal motives were guided by gendered expectations of behaviour and that these expectations were constructed to create meaning and understanding for family friends and witnesses Providing an insight into how people of this era understood suicidal behaviour and motives it challenges the assertion that suicide was seen as a distinctly feminine act and that men who took their own lives were feminized as a result Instead it shows that masculinity was understood in a more nuanced way than gender binaries allow and that a man's masculinity was measured against other men Focusing on four common narrative types the love suicide the unemployed suicide the suicide of the fraudster or speculator and the suicide of the dishonoured soldier it provides historical context to modern discussions about the crisis of masculinity and rising male suicide rates It reveals that narratives around male suicides are not so different today as they were then and that our modern model of masculinity can be traced back to the 19th century
