Methodologies for Digital Signal Processing Architectures Magdy A. Bayoumi, 2012-12-06 Designing VLSI systems represents a challenging task. It is a transposition among different specifications corresponding to different levels of design abstraction: behavioral, structural, and physical. The behavioral level describes the functionality of the design. It consists of two components: static and dynamic. The static component describes operations, whereas the dynamic component describes sequencing and timing. The structural level contains information about components' control and connectivity. The physical level describes the constraints that should be imposed on the floor plan: the placement of components and the geometry of the design. Constraints of area, speed, and power are also applied at this level. To implement such multilevel transposition, a design methodology should be devised, taking into consideration the constraints, limitations, and properties of each level. The mapping process between any of these domains is non-isomorphic. A single behavioral component may be transposed into more than one structural component. Design methodologies are the most recent evolution in the design automation era, which started off with the introduction and subsequent usage of module generation, especially for regular structures such as PLAs and memories. A design methodology should offer an integrated design system rather than a set of separate unrelated routines and tools. A general outline of a desired integrated design system is as follows: Decide on a certain unified framework for all design levels. Derive a design method based on this framework. Create a design environment to implement this design method.

Numerical Linear Algebra, Digital Signal Processing and Parallel Algorithms Gene H. Golub, Paul Van Dooren, 2012-12-06 Numerical linear algebra, digital signal processing, and parallel algorithms are three disciplines with a great deal of activity in the last few years. The interaction between them has been growing to a level that merits an Advanced Study Institute dedicated to the three areas together. This volume gives an account of the main results in this interdisciplinary field. The following topics emerged as major themes of the meeting: Singular value and eigenvalue decompositions including applications; Toeplitz matrices including special algorithms and architectures; Recursive least squares in linear algebra, digital signal processing, and control; Updating and downdating techniques in linear algebra and signal processing; Stability and sensitivity analysis of special recursive least squares problems; Special architectures for linear algebra and signal processing. This book contains tutorials on these topics given by leading scientists in each of the three areas. A considerable number of new research results are presented in contributed papers. The tutorials and papers will be of value to anyone interested in the three disciplines.
