Flow Control in Store-and-forward Computer Networks Chong-Wei Tseng, 1981 Document studies the broad area of flow control and sequencing in computer communication networks A special use of message sequencing is shown to reduce to a Markov process A more general sequencing model is also studied only approximate results are obtained in this case The author formally shows that an end to end flow control scheme in computer communication networks can be modeled as a closed network of queues He also introduces and analyzes a flow control scheme based on limiting the permit generation rates It turns out that this scheme is very effective More importantly this scheme involves essentially no computational complexity This allows us to measure and adjust the network performance with little difficulty The simplicity also allows us to incorporate more realistic aspects of network protocols such as piggy back acknowledgement time out and gate functions into our analysis Two simple but effective distributed dynamic flow control schemes are proposed and analyzed It is shown that with either of these two schemes a network can respond well to the dynamically changing environment

introduces the concept of Distributed FACTS D FACTS as an alternative approach to realizing cost effective power flow control By way of example a distributed series impedance DSI and a distributed static series compensator DSSC are shown that can be clipped on to an existing power line and can dynamically and statically change the impedance of the line so as to control power flow Details of implementation and system impact are presented in the paper along with experimental results
