Estevão, Ms. Beth Anne Wilson, 2013-05-03 Traditionally shocks to total factor productivity TFP are considered exogenous and the employment response depends on their effect on aggregate demand We raise the possibility that in response to labor supply shocks firms adjust efficiency rendering TFP endogenous to firms production decisions We present robust cross country evidence of a strong negative correlation between growth in TFP and labor inputs over the medium to long run In addition when using

instruments to capture changes in hours worked that are independent of TFP shocks we find that cross country increases in labor input cause reductions in TFP growth These results have important policy implications including that low productivity growth in some countries may partly be a side effect of strong labor market performance By the same token countries facing a declining workforce say because of aging may see accelerating TFP as firms find better ways of employing workers
