Grasslands in Europe Peter Veen, Richard Jefferson, Jacques de Smidt, Jan van der Straaten, 2014-04-14 Grasslands are an important element of European nature About half of Europe's endemic species depend on grasslands whether in mountains lowlands river plains or coastal areas Many grasslands originate in traditional agricultural landscapes Modern intensification however brings many of these ecosystems under threat Grasslands in Europe is a tribute to these important ecosystems It was written by an international team of grassland experts who describe twenty four case studies from countries in all of Europe ranging from the grasslands of Gotland and land Sweden to the Spanish Dehesa and from the hay meadows of the British Pennine Dales to the steppes of Turkish Anatolia Together these case studies provide a fascinating glimpse into the various European grasslands their value for nature culture and agriculture and the threats they are facing today The accessible text as well as the rich illustrations will appeal to a wide audience Grasslands in Europe contains a large number of stunning full colour photographs of grassland landscapes species and cultural history It also contains many maps and infographics Thematic chapters provide essential background information on topics such as grassland fauna the history of agriculture grassland communities and the connection between grasslands and climate The book also analyses the opportunities and risks of EU policy to conserve these grasslands It offers a farmer centred outlook to manage and to maintain the European grasslands of high nature value

Origin, Conservation, and Restoration of the Threatened European Grassland Ecosystem in the Anthropocene Grégory Mahy, Thierry Dutoit, Kathrin Kiehl, Armin Bischoff, Péter Török, 2024-11-07 Natural and Semi Natural Grassland Ecosystems NSG represent high value biodiversity hotspots for

biodiversity of the European continent as well as an invaluable cultural heritage forged through millennia of human nature interactions While pristine natural European grasslands result mainly from constrained specific climatic and soil conditions semi natural grasslands largely result from the activities of humans and their livestock e g grazing mowing burning during millennia of low intensity land use European NSG their biodiversity and the cultural heritage they represent are highly threatened since the beginning of the 20th century in a context of multifactorial global change including environmental dimensions climate change habitat fragmentation pollution biological invasions and land use changes with the accelerating of socio economic evolution of agricultural practices intensification or abandonment and urbanization *Habitats of Europe*

amateur and expert entomologists alike *Lowland Grassland and Heathland Habitats* Elizabeth Price, 2003-10-04
Grasslands are everywhere agricultural land playing fields and road verges but while species poor intensively managed grasslands are widespread colourful semi natural grasslands and heathlands buzzing with life are scarce These semi natural habitats are ancient cultural landscapes which are of considerable if not international importance for biodiversity However despite targets for the conservation and restoration of these valuable grasslands and heathlands these habitats continue to decline before our eyes *Lowland Grassland and Heathland Habitats* contrasts the uniformity of intensively managed grassland with the diversity of traditionally managed grasslands and heathlands It examines topics of concern to the ecologist or habitat manager such as causes of the loss and deterioration of these habitats including inappropriate management eutrophication and climate change It then evaluates opportunities for positive change such as conservation restoration and creation A series of case studies illustrates the pressures on some lowland grassland and heathland habitat types and looks at ways to enhance them for biodiversity This habitat guide features illustrated species boxes of typical plants and animals as well as a full species list a series of projects on the ecology of grassland and heathland species a colour plate section up to date references and information and a full glossary It will provide students and environmentalists with a deeper understanding of the nature and importance of lowland grasslands and heathlands *The Lapwing* Michael Shrubbs, 2009-01-01 A detailed authoritative yet highly readable monograph on one of Britain's best loved farmland birds the Lapwing With its striking green black and white plumage and distinctive pee wit call the Lapwing is one of Britain's best known birds Lapwings depend on agricultural land to breed and are considered a barometer of the health of this habitat the population has crashed over recent decades partly due to changes in farming practices In winter Lapwings switch to coastal areas and to wetlands including those in suburban areas where large noisy flocks can gather Michael Shrubbs's *The Lapwing* is a thorough review of Lapwing biology contains sections on population dynamics feeding ecology habitat use migration and conservation there is an impressively detailed review of our current understanding of breeding biology plus discussion of some other species in the genus *The Lapwing* is a superb addition to the Poyser list Of interest to both amateur naturalists who will enjoy insights into the bird's life and to academics who will appreciate the broad overview of current research this title will remain the definitive work on the species for many years to come *Wetlands in Central Europe* Gabriele Broll, Wolfgang Merbach, Eva-Maria Pfeiffer, 2013-04-18 Wetlands are very sensitive ecosystems functioning as a habitat for many organisms Protection and regeneration of wetlands are of great importance in ecological research and in nature conservation A huge amount of research has been done on the hydrology plants and animals in wetlands Knowledge about soil organisms and soil ecological processes of wetlands is still lacking This knowledge is a prerequisite for landscape planning purposes or climate change predictions In the case of climate change trace gas emissions from wetlands are of great interest The authors provide an overview of the state of the art on soil ecology in wetlands The book is divided into the

following main chapters Wetlands as habitats for soil organisms Soil ecological processes in fens and floodplains Carbon and nitrogen dynamics in soils with different water regimes and Trace gas emissions

Diversity and Stability in Aquatic Plant Communities Igor Zelnik, Mateja Germ, Rui Pedro Rivaes, 2025-08-08 Aquatic plant communities are crucial components of freshwater ecosystems often governing the ecological equilibrium and functionality of rivers streams and wetlands They encompass a diverse range of submerged emergent and floating plants supporting the overall balance and resilience of aquatic ecosystems They play a key role in various ecological and environmental contexts including ecosystem stability and the global carbon cycle as well as providing vital habitats for a diverse range of organisms Several factors shape the aquatic ecosystems ranging from light depth temperature of the water water flow and biotic factors to other external stressors that have over time modified the tolerance and presence of these communities Further research is required to shed light on the impact of increasing environmental changes and the need for a thorough understanding of how aquatic plant communities respond to such alterations The main goal of this Research Topic is to examine the complexities of aquatic plant communities and their dynamic interactions with different environmental factors We aim to explore aquatic plant functional diversity and compare its potential to reveal these interactions We also hope to investigate interactions between plants and other biological elements as well as how they cope with biological invasions Another goal is to examine the diverse responses of wetland vegetation to expected changes in the environmental factors driven by climate change We encourage scientists to submit their insights into the adaptive strategies of these communities Ultimately we hope to enhance our understanding of the ecological roles played by aquatic plants and to encourage effective conservation and management strategies for these vital ecosystems

Grasslands of the World Victor R. Squires, Jürgen Dengler, Limin Hua, Haiying Feng, 2018-09-05 This book begins with a brief account of the extraordinary sequence of events that led to emergence of grasslands as major vegetation formations that now occupy some of the driest and hottest and the highest and coldest on earth as well as vast steppes and prairies in more temperate climes It is the story of grasses successfully competing with

forests and woodlands aided and abetted by grazing herbivores and by humans and their use of fire as a tool It is a story of adaptation to changing climates and the changing biophysical environments A major focus of the book is the Palaearctic biogeographic realm that extends over some 45 million km² and thus more than 1/3 of the terrestrial ice free surface on Earth It comprises extensive grasslands of different types and origin which can be subdivided into 1 natural grasslands with 1a steppes climatogenic in dry climates 1b arctic alpine grasslands climatogenic in cold climates and 1c azonal and extrazonal grasslands pedogenic and topogenic as well as 2 secondary grasslands created and sustained by human activities such as livestock grazing mowing or burning Grasslands of the Palaearctic do not only form a major basis for the agriculture of the region and thus its food supply but are also crucial for other ecosystem services and host a supra proportional part of the realm's plant and animal diversity To reflect that suitability of grasslands for biodiversity strongly depends on their state we apply the term High Nature Value grassland to those natural grasslands that are not degraded in good state and those secondary grasslands that are not intensified semi natural The situation in a variety of countries where grasslands are evolving under the influence of global climate change is also considered Case studies are presented on Southern Africa Eastern Africa India China South America North America and Australia The concluding chapter examines a set of themes arising from the chapters that make up the bulk of this book The following provide a focus recent history of grassland biomes brief recap of current thinking and recent trends with special reference to dry grasslands in the Palearctic regions the current status of grasslands and germplasm resources biodiversity an overview management systems that ensure sustainability how to recover degraded grasslands socio economic issues and considerations in grassland management the impacts of environmental problems in grasslands such as future climate change and intensification and the problems prospects facing pastoralists and other grassland based livestock producers
