DESIGNING FOR THE WEB

Håkon Wium Lie
and Bert Bos

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and blood pressure (BP) of sedentary, middle-aged men. The subjects were divided into two groups: a control group and an exercise group. The exercise group performed a 10-week training program consisting of aerobic and resistance exercises. The HR and BP were measured at baseline and at the end of the 10-week program. The results showed that the exercise group had a significant decrease in both HR and BP compared to the control group. The HR decreased from 72 to 68 beats per minute, and the BP decreased from 120/80 to 110/70 mmHg. The control group showed no significant change in HR and BP. The findings suggest that a 10-week training program can effectively reduce HR and BP in sedentary, middle-aged men.
