**Abstract:-** Conventional Cold Fusion reactor has serious disadvantage that reaction rate is so low due to the lower concentration of D around the reaction site. Thus, I would like to propose the conceptualized Cold Fusion Reactor with D confined in the grain boundary of poly crystalline metal grain boundary, because D can stay in the grain boundary due to the smaller size of D<sup>+</sup>. In order to increase the reaction site the reactor has the multilayer metal film stacks. This reactor can transmute element with larger current of femto H<sub>2</sub>. Thus, I also would like to propose the conceptualized transmutation reactor with H<sub>2</sub> gas to prove the mechanism of Cold fusion because with H<sub>2</sub> femto H<sub>2</sub> can have two protons it will show the femto D<sub>2</sub> hypo of Cold Fusion mechanism is correct. The transmutation reactor needs to have target metal on the downside for femto H<sub>2</sub> to fall on it, and target metal need to be heated to increase the reaction rate of transmutation.

## I. INTRODUCTION

Cold fusion is a technology that will play an important role in hydrogen energy for the coming hydrogen society. Due to its high energy density and the use of deuterium as fuel, there is no concern of the depletion.

The authors are developing a cold fusion reactor with high power generation efficiency which can produce steam hot enough to turn a turbine to replace nuclear power plant. In addition, we are planning to prove the correct model of Cold fusion by femto D<sub>2</sub> model, and in order to prove the femto- D<sub>2</sub> we will show the existence of femto H<sub>2</sub> because hydrogen has only proton, and Deuteron is believed to have one proton and one neutron. In fact, the experiments showed that d is constituted by two protons.[1],[2],[3].

## II. HISTORY OF COLD FUSION

On March 23, 1989, Martin Fleischmann of the University of Southampton, UK, and Stanley Pons of the University of Utah, USA, announced to the media that they had discovered a phenomenon in which nuclear fusion occurs at room temperature, and the term cold fusion was

coined. It became widely known to the world. In this presentation, Fleischmann and Pons placed a palladium rod and a platinum plate electrode in a test tube filled with heavy water, left them for several days under deuterium absorption conditions, and passed an electric current. An exotherm to the extent that the part melted was observed. It was simply the very simple heavy water electrolysis experiment shown in FIG.1

Fig.1 Experimental Equipment in the Early Days of Cold Fusion

However, in this experiment, nuclear fusion just happened to occur at the stage of absorbing deuterium in the metal, is now called FPE(Fleischmann and Pons Effect).

**Protocols in Human Molecular Genetics** Christopher G.
