Abstract: The average life expectancy is increasing worldwide, but the same cannot be said for a healthy life expectancy (defined as the period during which a person can live a healthy and independent life). Therefore, a major challenge is how to extend healthy life expectancy. One option is to reduce age-related muscle atrophy (sarcopenia) and cognitive decline. Since there is no specific cure for frailty, the prevention of frailty based on nutrition and exercise is a new approach to achieve healthy longevity. Studies have shown that interventions combining nutritional supplements and exercise are effective in improving muscle strength, muscle mass, and walking speed. Thus, the search for drugs and functional foods to combat frailty has attracted researchers' attention. Whale meat extract (WME) contains many imidazole dipeptides, especially the unique component balenine, which has various functional anti-fatigue and antioxidant properties, and hypermobility effects. Here, we investigated the effects of WME on the aging and health of *Caenorhabditis elegans* (hereafter, *C. elegans*). mRNA expression analysis showed that WME prolongs the lifespan of *C. elegans* mainly through *sir-2.1*, *daf-2*, and *daf-16*, and the *myo-3*, *unc-54*, *unc-22*, and *flou-1* genes involved in locomotor function. The results of this study showed that the expression of the antioxidant enzymes *sod-2* and *sod-3* was also increased. This study may provide the basis for further research on WME as a food and supplement to slow aging and improve motor function.

1. Introduction

Healthy life expectancy is an indicator by the World Health Organization (WHO) that indicates the “average period of unrestricted daily life” during which a person can live independently and in good health. Efforts to narrow the gap between average life expectancy and healthy life expectancy are important, since even if life expectancy itself increases, it becomes less significant with declining health and mobility. Lifestyle modification, diet, and exercise are considered important to prevent the disease development and cognitive decline associated with aging and to extend healthy life expectancy. Recently, the intake of natural products has attracted attention as a simple way to reduce various risks associated with aging.

We have been conducting various investigations for the use of balenine [1–3], an imidazole dipeptide highly concentrated in whale meat, as an anti-fatigue food. It is becoming clear that imidazole dipeptide has antioxidant, anti-fatigue, and athletic performance-enhancing effects [4–6], improves cognitive function [7–9], and has a role in maintaining muscle function [10]. While carnosine and anserine have been studied variously, including their use as supplements to improve health, increasing research is being carried out

Prado,2010-11-01 This book examines the reactions of the friends and family of those who elect to die due to terminal illness. These surviving spouses, partners, relatives, and friends, in addition to coping with the death of a loved one, must also deal with the loved one's decision to die, thus severing the relationship. C. G. Prado examines how reactions to elective death are influenced by cultural influences and beliefs, particularly those related to life, death, and the possibility of an afterlife. Understanding the role of these cultural influences on the grieving processes of survivors is a crucial step in allowing them to accept both intellectually and emotionally the finality of elective death and to deal with the decision of their loved one.
