## **Immune Networks:**

**Theories of Immune Networks** Henri Atlan, Irun R. Cohen, 2012-12-06 For a long time immunology has been dominated by the idea of a simple linear cause effect relationship between the exposure to an antigen and the production of specific antibodies against that antigen Clonal selection was the name of the theory based on this idea and it has provided the main concepts to account for the known features of the immune response More recently immunologists have discovered a wealth of new facts in the form of different regulatory cells helpers suppressors antigen presenting cells genetic determinations of immune responses such as those involved in graft rejections different molecular structures responsible for intercellular interactions such as interleukins cytokins idiotype antiidiotype recognition and others While furthering our understanding of the local interactions molecular and cellular involved in the immune response these discoveries have led to a questioning of the simplicities of the classical clonal selection theory It is clear today that every single immune response is a cooperative phenomenon involving several different molecular and cellular interactions taking place in a coupled manner In addition cross reactivity to different antigens has shown that responses of the whole immune system to different antigens are not completely isolated from one another and that the history of encounters with different antigens plays a crucial role in the maturation of the whole system Thus problems of complexity generation of diversity and self organization have entered the field of immunology

*Biological Networks* François Képès, 2007 This volume presents a timely and comprehensive overview of biological networks at all organization levels in the spirit of the complex system approach It discusses the transversal issues and fundamental principles as well as the overall structure dynamics and modeling of a wide array of biological networks at the molecular cellular and population levels Anchored in both empirical data and a strong theoretical background the book therefore lends valuable credence to the complex systems approach

*The Network Collective* Klaus Eichmann, 2008-11-18 The network paradigm dominated immunological research from the early 1970s to the late 1980s The originator Niels Jerne hypothesized that the vast diversity of antibodies in each individual forms a network of mutual idiotypic recognition thus regulating the immune system In context of emerging concepts of systems biology such as cybernetics and autopoiesis the Eigenbehavior of the immune system fascinated an entire generation of young immunologists But fascination led to experimental errors and overinterpretation eventually magnifying the immune system from a mere infection fighting device to a substrate of personality and individuality As a result what

initially appeared as an exciting new perspective of the immune system is now viewed as a scientific vagary and is largely abandoned The author himself a participant in the network vagary begins with a description of the leading theoretical concepts on fact finding in science This is followed by a historical account of the rise and fall of the network paradigm complemented by personal interviews with some of the prominent protagonists By comparing the network paradigm to other more lasting concepts in life science the author develops a general perspective on how solid knowledge is derived from error prone scientific methodology namely by exposure of scientific notions to the scrutiny of reality **Naturally Occurring**

**Antibodies (NAbS)** Hans U. Lutz, 2012-08-19 This volume illustrates the functional properties of NAbS Authors from pioneering groups report in their chapters on the tissue homeostatic tissue regenerating and regulatory properties of NAbS and NAbS in pooled human IgG Scientists interested in the regulation and modulation of components of the immune system found a whole variety of NAbS to cytokines with regulatory and protective functions and NAbS that modulate e g dendritic cells regulatory T cells B cells and granulocytes Considering the large plasma pools and initial difficulties in preparing IVIG that does not induce adverse effects upon infusion into recipients this volume ends with a historical chapter on how pooled human plasma was fractionated and the IgG component pretreated for a safe intravenous application **Acting Bodies and**

Kiani, David Gomez-Cabrero, Ginestra Bianconi, 2021-04-01

Biological systems are extremely complex and have emergent properties that cannot be explained or even predicted by studying their individual parts in isolation. The reductionist approach, although successful in the early days of molecular biology, underestimates this complexity. As the amount of available data grows, so it will become increasingly important to be able to analyse and integrate these large data sets. This book introduces novel approaches and solutions to the Big Data problem in biomedicine and presents new techniques in the field of graph theory for handling and processing multi-type large data sets. By discussing cutting-edge problems and techniques, researchers from a wide range of fields will be able to gain insights for exploiting big heterogeneous data in the life sciences through the concept of network of networks.

Self-organization and Emergence in Life Sciences Bernard Feltz, Marc Crommelinck, Philippe Goujon, 2006-01-13 Self-organization constitutes one of the most important theoretical debates in contemporary life sciences. The present book explores the relevance of the concept of self-organization and its impact on such scientific fields as immunology, neurosciences, ecology, and theories of evolution. Historical aspects of the issue are also broached. Intuitions relative to self-organization can be found in the works of such key western philosophical figures as Aristotle, Leibniz, and Kant. Interacting with more recent authors and cybernetics, self-organization represents a notion in keeping with the modern world's discovery of radical complexity. The themes of teleology and emergence are analyzed by philosophers of sciences with regards to the issues of modelization and scientific explanation. The implications of self-organization for life sciences are here approached from an interdisciplinary angle, revealing the notion as already rewarding and full of promise for the future. **WCNN'96, San Diego, California, U.S.A.** International Neural Network Society, 1996 Library of Congress Subject Headings Library of Congress, Library of Congress. neuroscience inquiry retaining brief references to a larger context that includes the study of neurology anthropology paleontology computer science and philosophy There have been several attempts to develop a theory of brain function that incorporates a large collection of observations experimental results and a growing understanding of the innate features of human nature I doubt that a single theory is feasible and suggest that the goal is integration of knowledge from diverse disciplines into a comprehensive understanding of who we are and why we are the way we are     Theoretical Immunology, Part Two Alan S. Perelson, 2018-02-19 Assuming that the complex phenomena underlying the operation of the immune system may be better understood through the collaborative efforts of theorists and experimentalists viewing the same phenomena in different ways the Sante Fe Institute and the Theoretical Division of Los Alamos National Laboratory cosponsored a workshop entitled Theoretical Immunology The workshop focused on themes spanning the field of immunology with emphasis on areas where the theorists have made the most progress This book covers the discussions at that workshop on the topics of immune surveillance mathematical models of HIV infection complexities of antigen antibody systems immune suppression and tolerance and idiotypic networks In each of these areas there is reason to believe that advances can be made either through interactions among experimentalists and theorists or through the critical look experimentalists and theorists will bring to bear upon one another's work
