Immunogenetics And Immunodeficiency:

Immunogenetics and Immunodeficiency Baruj Benacerraf, 1975-11-30 The identification of the genes which determine biological phenomena and the study of the control they exert on these phenomena has proven to be the most successful approach to a detailed understanding of their mechanism The greatest advances in molecular biology have relied upon the application of the methodology of genetics to the elucidation of the fundamental processes of life at the cellular level The same statement may be made concerning our understanding of immunological phenomena The genetic approach has again proven extremely productive and has permitted us to identify many fundamental questions in immunobiology and to resolve some of them successfully Among the problems with which the young discipline of immunogenetics has been concerned are the structural genes of the immunoglobulin chains These genes have been identified by their control of allotypic antigenic determinants on the constant segment of H chains of different classes on the constant segments of L chains and on both the constant and variable regions of rabbit H chains These studies have provided the first evidence for the control of a single polypeptide chain by two distinct structural genes Much has been learned concerning the genes coding the C and V regions of immunoglobulin chains a from the study of the inheritance of allotypic and idiotypic determinants on these chains discussed by Kunkel and Kindt and b from the analysis of the amino acid sequence in immunoglobulin chains from individual myeloma proteins and abnormal paraproteins discussed by Frangione

The Scid Mouse Melvin J. Bosma, Robert A. Phillips, Walter Schuler, 2013-03-07 During routine genetic screening of several immunoglobulin heavy chain congenic mouse strains in 1980 one of us MB was surprised to find that several mice in the C B 17Icr strain which was being maintained in a specific pathogen free facility of the Fox Chase Cancer Center Philadelphia PA did not express serum immunoglobulin of the appropriate allotype Fearing an error in the breeding of these mice the sera of the suspect mice were screened for other allotypes When these tests revealed a complete absence of serum immunoglobulin it became apparent that a mutation had probably occurred in the C B 17Icr line Further analysis revealed that a single breeding pair was responsible for all of the immunoglobulin negative mice and that the defect showed recessive inheritance Thus was the C B 17 Icr scid or severe combined immune deficient scid mouse discovered Although it has taken most animal facilities several years to breed scid mice of high quality for experimental purpose it was clear by 1987 that many investigators were beginning to exploit the unique qualities of the scid mouse for studies in several areas
