Immunology is defined as the study of the molecules, cells, organs, and systems responsible for the recognition and disposal of foreign material. Immunology began as a branch of microbiology. The study of infectious disease and the body's response to them has a major role for the development of immunology. Moreover, the concept of germ theory

of disease has contributed to the field of immunology. It was Edward Jenner who first studied the response of the body to foreign substances. He observed that dairy maids who had naturally contracted a mild infection called cowpox seemed to be protected against smallpox, a horribly disfiguring disease and a major killer. Serology is the diagnostic identification of antibodies in the serum and other bodily fluids. Such antibodies are typically formed in response to an infection against a given microorganism, against other foreign proteins in response, for example, to a mismatched blood transfusion or to one's own proteins in instances of autoimmune disease. Serological tests may be performed for diagnostic purposes when an infection is suspected in rheumatic illnesses and in many other situations such as checking an individual's blood type. Serology blood tests help to diagnose patients with certain immune deficiencies associated with the lack of antibodies such as X-linked agammaglobulinemia. In such cases, tests for antibodies will be consistently negative. There are several serology techniques that can be used depending on the antibodies being studied. These include ELISA, agglutination, precipitation, complement fixation, and fluorescent antibodies, and more recently chemiluminescence. Some serological tests are not limited to blood serum but can also be performed on other bodily fluids such as semen and saliva and spinal fluid (CSF) which may contain antibodies. This book starts with a small historical introduction to Immunology. The next chapters, sections 1 to 4, give examples of Serology applied to infectious diseases: HPV, Hepatitis, Malaria, and Dengue. Section 5 is dedicated to the application of serology to celiac diagnosis. Section 6 shows the application of serology to other pathogens: Lyme disease, Sjögren's syndrome, Chlamydia pneumoniae, HIV, Influenza virus, Mycobacterium, Toxoplasmosis, and Leprosy. Several serologic-based diagnostic techniques are used and are being developed daily, making this one of the biggest fields in science research.

**Diagnostic Immunology and Serology: A Clinicians' Guide** J.D. Wilson, S.I. Simpson, 2012-12-06. Immunology as an independent discipline is just 100 years old. In the Pasteurian era, it was the direct handmaiden of medical microbiology, but with Landsteiner's discovery of the blood groups in 1901, immunology burst through into other fields. This spreading of immunology into many facets of biology and medicine has continued at an accelerating pace, particularly over these last 20 years. For the physician, immunology is a horizontal specialty breaking the confines of a single organ system and touching an enormous number of chronic diseases. This spreading tendency of immunology is both a source of great fascination and great frustration. The research worker in immunology is delighted to be engaged at so many frontiers. The clinician who must use the new research knowledge to help the patient can easily be confused and overwhelmed. The fact that immunology is poorly taught in most medical courses makes things worse. These are the reasons why physicians, clinical pathologists, and undergraduate and postgraduate students should hail the publication of *Diagnostic Immunology and Serology*.
