Mechanics of Sandwich Structures A. Vautrin, 2013-06-29

The main advantages of sandwiches as structural components are now well known and well established. Due to the progress in polymer science and engineering and advances in manufacturing processes, sandwich structures can blend various functional and structural properties and therefore lead to highly innovating systems. The current difficulty to overcome is to provide designers with proper methodologies and tools that could enable them to design improved sandwich structures. Such dedicated design tools should be efficient, reliable, flexible, and user friendly. They should be based on advanced knowledge of sandwich behaviour at global and local scales. Such approach relies on our capability to test, identify, control, and model structure performances. The impressive variety of core and face materials and the rapid developments in forming processes give new opportunities to design components which have more complex shapes and higher integrated functional and structural properties. Interest in sandwiches is permanently growing in industry, and refined testing and modelling approaches should be encouraged to set up relevant guidelines to design reliable advanced structures. The European Society for Mechanics sponsored the EUROMECH 360 Colloquium on the Mechanics of Sandwich Structures in Saint Etienne, France, on 13-15 May 1997. The main purpose of EUROMECH 360 was to go into the most recent progresses in sandwich analysis and design, including mechanical modelling and testing. It was expected that the Colloquium should contribute to define new research directions to support development of advanced applications in strategic industrial sectors such as ground transportations or building and civil engineering.

Conference Proceedings Society of Plastics Engineers. Technical Conference, 1998

Temperature-Fatigue Interaction L. Remy, J. Petit, 2002-03-11. This volume contains a selection of peer reviewed papers presented at the International Conference on Temperature Fatigue Interaction held in Paris, May 29-31, 2001, organised by the Fatigue Committee of the Societ Fran aise de M tallurgie et de Mat riaux SF2M under the auspices of the European Structural Integrity Society. The conference disseminated recent research results and promoting the interaction and collaboration amongst materials scientists, mechanical engineers, and design engineers. Many engineering components and structures used in the automotive, aerospace, power generation, and many other industries experience cyclic mechanical loads at high temperature or temperature transients causing thermally induced stresses. The increase of operating temperature and thermal mechanical loading trigger the interaction with time dependent phenomena such as creep and environmental effects, oxidation, corrosion. A large number of metallic materials were investigated, including aluminium alloys for the automotive industry, steels and cast iron for the automotive industry, and materials forming stainless steels for power plants, titanium composites, intermetallic alloys, and nickel base superalloys for aircraft industry, polymers. Important progress was observed in testing practice for high temperature behaviour, including environment and thermo mechanical loading, as well as in observation techniques. A large problem which was emphasized is to know precisely service loading cycles under non isothermal conditions. This was considered critical for numerous thermal fatigue problems discussed in this conference.
