Implementation of Functional Languages with State Jonathan Charles Springer,1996 Imperative and functional programming are two styles which have long been viewed as incompatible In particular the functional property of referential transparency could not be maintained in the face of destructive update as found in assignment statements Recent work however has suggested that the two may be integrated in a formal system which has both imperative features and referential transparency These systems impose certain constraints on imperative features that allow the effects to be masked out making them appear purely functional Despite the presence of these formal systems many questions of practicality remain unanswered In this thesis we attempt to address these issues In particular we have created a language ALV based on the formal system lambdasb var and implemented ALV as a compiler We have also extended a formal analysis known as abstract interpretation typically applied to functional languages to this language Additionally we have explored ways to make the use of imperative features more convenient such as by relaxing the restrictions on the use of imperative constructs
