# Enzymes

**TEKS** 9C

### VOCABULARY

catalyst  
enzyme  
substrate

**KEY CONCEPT** Enzymes are catalysts for chemical reactions in living things.

### MAIN IDEAS

- A catalyst lowers activation energy.
- Enzymes allow chemical reactions to occur under tightly controlled conditions.

**TEKS** 9C Identify and investigate the role of enzymes.

### Connect to Your World

How can a Venus flytrap digest a frog? It happens through the action of proteins called enzymes. Enzymes help to start and run chemical reactions in living things. For example, enzymes are needed to break down food into smaller molecules that cells can use. Without enzymes, a Venus flytrap couldn't break down its food, and neither could you.

### MAIN IDEA

## A catalyst lowers activation energy.

Remember what you learned about activation energy in Section 4. Activation energy for a chemical reaction is like the energy that is needed to push a rock up a hill. When enough energy is added to get the rock to the top of a hill, the rock can roll down the other side by itself. Activation energy gives a similar push to a chemical reaction. Once a chemical reaction starts, it can continue by itself, and it will go at a certain rate.

Often, the activation energy for a chemical reaction comes from an increase in temperature. But even after a chemical reaction starts, it may happen very slowly. The reactants may not interact enough, or they may not be at a high enough concentration, to quickly form the products of the reaction. However, both the activation energy and rate of a chemical reaction can be changed by a chemical catalyst, as shown in **FIGURE 5.1**. A **catalyst** (KAT-i-hst) is a substance that decreases the activation energy needed to start a chemical reaction and, as a result, also increases the rate of the chemical reaction.

**FIGURE 5.1 CATALYSTS AND ACTIVATION ENERGY**

Under normal conditions, a certain amount of activation energy is needed to start a chemical reaction. A catalyst decreases the activation energy needed.

Biological Complexity and the Dynamics of Life Processes J. Ricard, 1999-11-01 The aim of this book is to show how supramolecular complexity of cell organization can dramatically alter the functions of individual macromolecules within a cell The emergence of new functions which appear as a consequence of supramolecular complexity is explained in terms of physical chemistry The book is interdisciplinary at the border between cell biochemistry physics and physical chemistry This

interdisciplinarity does not result in the use of physical techniques but from the use of physical concepts to study biological problems In the domain of complexity studies most works are purely theoretical or based on computer simulation The present book is partly theoretical partly experimental and theory is always based on experimental results Moreover the book encompasses in a unified manner the dynamic aspects of many different biological fields ranging from dynamics to pattern emergence in a young embryo The volume puts emphasis on dynamic physical studies of biological events It also develops in a unified perspective this new interdisciplinary approach of various important problems of cell biology and chemistry ranging from enzyme dynamics to pattern formation during embryo development thus paving the way to what may become a central issue of future biology
