Epidemic Modelling An Introduction:

Epidemic Modelling Daryl J. Daley, Joseph Mark Gani, 1999 This is a general introduction to the mathematical techniques needed to understand epidemiology It begins with an historical outline of some disease statistics before describing simple deterministic and stochastic models

Epidemic Modelling D. J. Daley, J. Gani, 2001-05-28 This general introduction to the mathematical techniques needed to understand epidemiology begins with an historical outline of some disease statistics dating from Daniel Bernoulli's smallpox data of 1760 The authors then go on to describe simple deterministic and stochastic models in continuous and discrete time for epidemics taking place in either homogeneous or stratified nonhomogeneous populations They offer a range of methods for constructing and analyzing models mostly in the context of viral and bacterial diseases of human populations These models are contrasted with models for rumors and macro parasitic diseases Questions of fitting data to models and the use of models to understand methods for controlling the spread of infection are discussed Exercises and complementary results at the end of each chapter extend the scope of the text

Dynamic Models of Infectious Diseases V. Sree Hari Rao, Ravi Durvasula, 2013-11-30 Though great advances in public health are witnessed world over in recent years infectious diseases besides insect vector borne infectious diseases remain a leading cause of morbidity and mortality Control of the epidemics caused by the non vector borne diseases such as tuberculosis avian influenza H5N1 and cryptococcus gattii have left a very little hope in the past The advancement of research in science and technology has paved way for the development of new tools and methodologies to fight against these diseases In particular intelligent technology and machine learning based

methodologies have rendered useful in developing more accurate predictive tools for the early diagnosis of these diseases In all these endeavors the main focus is the understanding that the process of transmission of an infectious disease is nonlinear not necessarily linear and dynamical in character This concept compels the appropriate quantification of the vital parameters that govern these dynamics This book is ideal for a general science and engineering audience requiring an in depth exposure to current issues ideas methods and models The topics discussed serve as a useful reference to clinical experts health scientists public health administrators medical practioners and senior undergraduate and graduate students in applied mathematics biology bioinformatics and epidemiology medicine and health sciences
