CEV CHERMID Vaccine and Infectious Disease Institute University of Antwerp have collaborated over the past 15 years This book demonstrates the past and current research activities of these institutes and can be considered to be a milestone in this collaboration This book is focused on the application of modern statistical methods and models to estimate infectious disease parameters We want to provide the readers with software guidance such as R packages and with data as far as they can be made publicly available   *Population Parameters* Hamish McCallum,2008-04-15 Ecologists and environmental managers rely on mathematical models both to understand ecological systems and to predict future system behavior In turn models rely on appropriate estimates of their parameters This book brings together a diverse and scattered literature to provide clear guidance on how to estimate parameters for models of animal populations It is not a recipe book of statistical procedures Instead it concentrates on how to select the best approach to parameter estimation for a particular problem and how to ensure that the quality estimated is the appropriate one for the specific purpose of the modelling exercise Commencing with a toolbox of useful generic approaches to parameter estimation the book deals with methods for estimating parameters for single populations These parameters include population size birth and death rates and the population growth rate For such parameters rigorous statistical theory has been developed and software is readily available The problem is to select the optimal sampling design and method of analysis The second part of the book deals with parameters that describe spatial dynamics and ecological interactions such as competition predation and parasitism Here the principle problems are designing appropriate experiments and ensuring that the quantities measured by the experiments are relevant to the ecological models in which they will be used This book will be essential reading for ecological researchers postgraduate students and environmental managers who need to address an ecological problem through a population model It is accessible to anyone with an understanding of basic statistical methods and population ecology Unique in concentrating on parameter estimation within modelling Fills a glaring gap in the literature Not too technical so suitable for the statistically inept Methods explained in algebra but also in worked examples using commonly available computer packages SAS GLIM and some more specialised packages where relvant Some spreadsheet based examples also included   *Encyclopedia of Statistical Sciences, Volume 3* ,2005-12-16 Countless professionals and students who use statistics in their work rely on the multi volume Encyclopedia of Statistical Sciences as a superior and unique source of information on statistical theory methods and applications This new edition available in both print and on line versions is designed to bring the encyclopedia in line with the latest topics and advances made in statistical science over the past decade in areas such as computer intensive statistical methodology genetics medicine the environment and other applications Written by over 600 world renowned experts including the editors the entries are self contained and easily understood by readers with a limited statistical background With the publication of this second edition in 16 printed volumes the Encyclopedia of Statistical Sciences retains its position as a cutting edge reference of choice for those working in statistics biostatistics quality control

Quantitative Methods for Investigating Infectious Disease Outbreaks Ping Yan,Gerardo Chowell,2019-08-16 This book provides a systematic treatment of the mathematical underpinnings of work in the theory of outbreak dynamics and their control covering balanced perspectives between theory and practice including new material on contemporary topics in the field of infectious disease modelling Specifically it presents a unified mathematical framework linked to the distribution theory of non negative random variables the many examples used in the text are introduced and discussed in light of theoretical perspectives The book is organized into 9 chapters The first motivates the presentation of the material on subsequent chapters Chapter 2 3 provides a review of basic concepts of probability and statistical models for the distributions of continuous lifetime data and the distributions of random counts and counting processes which are linked to phenomenological models Chapters 4 focuses on dynamic behaviors of a disease outbreak during the initial phase while Chapters 5 6 broadly cover compartment models to investigate the consequences of epidemics as the outbreak moves beyond the initial phase Chapter 7 provides a transition between mostly theoretical topics in earlier chapters and Chapters 8 and 9 where the focus is on the data generating processes and statistical issues of fitting models to data as well as specific mathematical epidemic modeling applications respectively This book is aimed at a wide audience ranging from graduate students to established scientists from quantitatively oriented fields of epidemiology mathematics and statistics The numerous examples and illustrations make understanding of the mathematics of disease transmission and control accessible Furthermore the examples and exercises make the book suitable for motivated students in applied mathematics either through a lecture course or through self study This text could be used in graduate schools or special summer schools covering research problems in mathematical biology Modelling Geographical Systems B. Boots,A. Okabe,R. Thomas,2013-11-11 Within the realm of quantitative geography systems modelling is specifically concerned with understanding those relationships that influence the attributes of phenomena located in space and time The intention is to replicate the main processes influencing a system s behaviour and thereby assist its manage ment through a capability to estimate future change Over the last few decades one of the major institutional initiatives for promoting such research has been provided by specialised Study Groups and Commissions established by the International Geographical Union IGU These scholarly networks have aimed to co ordinate international research agendas for geographical systems model ling and their activities have been recorded in both edited volumes Fischer and Getis 1997 and special issues of learned journals Wilkinson and Boots 2000 Leung and Okabe 2001 Presently this facilitative task is the charge of the Commission on Modelling Geographical Systems CMGS appointedat the IGU Hague Congress in 1996 and chaired by Barry Boots 1996 2000 and Richard Thomas 2000 present Set against this background this book provides a perspective on the work of the CMGS from 1996 until the IGU Seoul Congress in August 2000 through a collection of papers first presented to our sessions at this event

Mathematical Epidemiology of Infectious Diseases O. Diekmann,J. A. P. Heesterbeek,2000-04-07 Mathematical Epidemiology of Infectious Diseases Model Building Analysis and Interpretation O Diekmann University of Utrecht The Netherlands J A P Heesterbeek Centre for Biometry Wageningen The Netherlands The mathematical modelling of epidemics in populations is a vast and important area of study It is about translating biological assumptions into mathematics about mathematical analysis aided by interpretation and about obtaining insight into epidemic phenomena when translating mathematical results back into population biology Model assumptions are formulated in terms of usually stochastic behaviour of individuals and then the resulting phenomena at the population level are unravelled Conceptual clarity is attained assumptions are stated clearly hidden working hypotheses are attained and mechanistic links between different observables are exposed Features Model construction analysis and interpretation receive detailed attention Uniquely covers both deterministic and stochastic viewpoints Examples of applications given throughout Extensive coverage of the latest research into the mathematical modelling of epidemics of infectious diseases Provides a solid foundation of modelling skills The reader will learn to translate model analyse and interpret with the help of the numerous exercises In literally working through this text the reader acquires modelling skills that are also valuable outside of epidemiology certainly within population dynamics but even beyond that In addition the reader receives training in mathematical argumentation The text is aimed at applied mathematicians with an interest in population biology and epidemiology at theoretical biologists and epidemiologists Previous exposure to epidemic concepts is not required as all background information is given The book is primarily aimed at self study and ideally suited for small discussion groups or for use as a course text   **Disease Evolution** Zhilan Feng,Ulf Dieckmann,Simon A. Levin, Infectious diseases are continuing to threaten humankind While some diseases have been controlled new diseases are constantly appearing Others are now reappearing in forms that are resistant to drug treatments A capacity for continual re adaptation furnishes pathogens with the power to escape our control efforts through evolution

This makes it imperative to understand the complex selection pressures that are shaping and reshaping diseases Modern models of evolutionaryepidemiology provide powerful tools for creating expressing and testing such understanding Bringing together international leaders in the field this volume offers a panoramic tour of topical developments in understanding the mechanisms of disease evolution The volume s first part elucidates the generalconcepts underlying models of disease evolution Methodological challenges addressed include those posed by spatial structure stochastic dynamics disease phases and classes single and multi drug resistance the heterogeneity of host populations and tissues and the intricate coupling of disease evolution with between host and within host dynamics The book s second part shows how these methods are utilized for investigating the dynamics and evolution of specific diseases includingHIV AIDS tuberculosis SARS malaria and human rhinovirus infections This volume is particularly suited for introducing young scientists and established researchers with backgrounds in mathematics computer science or biology to the current techniques and challenges of mathematical evolutionaryepidemiology **Nonlinear Dynamics and Evolution Equations** Hermann Brunner,Xiao-Qiang Zhao,Xingfu Zou,2006 The papers in this volume reflect a broad spectrum of current research activities on the theory and applications of nonlinear dynamics and evolution equations They are based on lectures given during the International Conference on Nonlinear Dynamics and Evolution Equations at Memorial University of Newfoundland St John s NL Canada July 6 10 2004 This volume contains thirteen invited and refereed papers Nine of these are survey papers introducing the reader to anddescribing the current state of the art in major areas of dynamical systems ordinary functional and partial differential equations and applications of such equations in the mathematical modelling of various biological and physical phenomena These papers are complemented by four research papers thatexamine particular problems in the theory and applications of dynamical systems Information for our distributors Titles in this series are copublished with the Fields Institute for Research in Mathematical Sciences Toronto Ontario Canada **Mathematical and Statistical Modeling for Emerging and Re-emerging Infectious Diseases** Gerardo Chowell,James M. Hyman,2016-07-27 The contributions by epidemic modeling experts describe how mathematical models and statistical forecasting are created to capture the most important aspects of an emerging epidemic Readers will discover a broad range of approaches to address questions such as Can we control Ebola via ring vaccination strategies How quickly should we detect Ebola cases to ensure epidemic control What is the likelihood that an Ebola epidemic in West Africa leads to secondary outbreaks in other parts of the world When does it matter to incorporate the role of disease induced mortality on epidemic models What is the role of behavior changes on Ebola dynamics How can we better understand the control of cholera or Ebola using optimal control theory How should a population be structured in order to mimic the transmission dynamics of diseases such as chlamydia Ebola or cholera How can we objectively determine the end of an epidemic How can we use metapopulation models to understand the role of movement restrictions and migration patterns on the spread of infectious diseases How can we capture the impact of household
